INSTALLATION & OPERATION MANUAL

MP-18-SERIES TOUCHSCREEN
ELECTRIC/HYDRAULIC
PORTABLE LIFT
2, 4, 6 & 8 POST ARRANGEMENTS

MOHAWK RESOURCES LTD.
65 VROOMAN AVENUE
P. O. BOX 110
AMSTERDAM, NY 12010
TOLL FREE: 1-800-833-2006
FAX: 1-518-842-1289
LOCAL: 1-518-842-1431

READ MANUAL THOROUGHLY
BEFORE INSTALLING,
OPERATING OR SERVICING THIS
LIFT !!
Deliver these instructions to lift
owner/user/employer along with other
instructional materials furnished with
this lift.

Rev: 12/1/2015
Part No. : 601-800-389

See Manual for specific Models
Certified to ANSI/ALI ALCTV.
IMPORTANT SAFETY INSTRUCTIONS
When using this garage equipment, basic safety precautions should always be followed, including the following:

1. **Read all instructions.**
2. Inspect lift daily. Do not operate if it malfunctions or problems have been encountered.
3. Never attempt to overload the lift. The manufacturer’s rated capacity is shown on the identification label on the power side column. Do not override the operating controls or the warranty will be void.
4. Only trained and authorized personnel should operate the lift. Do not allow customers or bystanders to operate the lift or be in the lift area.
5. Position the lift support forks to contact the vehicle tires. Raise the lift until the forks contact the tires. Check forks for secure contact with the vehicle tires, then raise the lift to the desired working height.
6. NOTE: Always use all 4 posts to raise and support vehicle.
7. Note that the removal or installation of some vehicle parts may cause a critical load shift in the center of gravity and may cause the vehicle to become unstable. Refer to the vehicle manufacturer’s service manual for recommended procedures.
8. Always keep the lift area free of obstructions and debris. Grease and oil spills should always be cleaned up immediately.
10. Before lowering check area for any obstructions.
11. Before driving vehicle between the posts, position the lift forks to allow vehicle to freely enter lifting area. To not hit or run over forks as this could damage the lift and/or the vehicle.
12. Before removing the vehicle from the lift area, position the lift forks to allow vehicle to freely leave lifting area. To not hit or run over forks as this could damage the lift and/or the vehicle.
13. Care must be taken as burns can occur from touching hot parts.
14. Do not operate equipment with a damaged cord or if the equipment has been dropped or damaged – until a qualified serviceman has examined it.
15. Do not let cords hang over tables, benches or counters or come in contact with hot manifolds or moving fan blades.
16. If an extension cord is necessary, a cord with a current rating equal to or more than that of the equipment should be used. Cords rated for less current than the equipment may overheat. Care should be taken to arrange the cord so that it will not be tripped over or pulled.
17. Always unplug the equipment from electrical outlet when not in use. Never use the cord to pull the plug from the outlet. Grasp plug and pull to disconnect.
18. Let equipment cool completely before pulling away. Loop cord loosely around equipment when storing.
19. To reduce the risk of fire, do not operate equipment in the vicinity of open containers of flammable liquids (gasoline).
20. Adequate ventilation should be provided when working on operating internal combustion engines.
21. Keep hair, loose clothing, fingers, and all parts of body way from moving parts.
22. To reduce the risk of electrical shock, do not use on wet surfaces or expose to rain.
23. Use only as described in this manual. Use only manufacturer’s recommended attachments.
24. **ALWAYS WEAR SAFETY GLASSES.** Everyday eyeglasses have only impact resistant lenses, and they are NOT safety glasses.

MOHAWK WARRANTIES
EFFECTIVE DATE: 12/1/2015*
READ THIS WARRANTY IN ITS ENTIRETY

GENERAL WARRANTY INFORMATION:
MOHAWK’S OBLIGATION UNDER THIS WARRANTY IS LIMITED TO REPAIRING OR REPLACING ANY PART OR PARTS RETURNED TO THIS FACTORY, TRANSPORTATION CHARGES PREPAID BY CUSTOMER WITH AUTHORIZED RETURN (RGA), WHICH PROVE UPON INSPECTION TO BE DEFECTIVE AND WHICH HAVE NOT BEEN MISUSED. DAMAGE OR FAILURE TO ANY PART DUE TO FREIGHT DAMAGE OR LACK OF REQUIRED REGULAR DOCUMENTED MAINTENANCE IS NOT COVERED UNDER THIS WARRANTY. ALL WARRANTY CLAIMS MUST BE PERFORMED IN ACCORDANCE TO MOHAWK’S WARRANTY PARTS RETURN POLICY (CONTACT MOHAWK’S SERVICE DEPARTMENT FOR MORE INFORMATION).

THIS WARRANTY DOES NOT COVER MIS-DIAGNOSING OF UNIT OR PARTS RETURNED THAT ARE NON-DEFECTIVE. THIS WARRANTY DOES NOT COVER ANY CONSEQUENTIAL OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, LOST REVENUES OR BUSINESS HARM. THIS EQUIPMENT HAS BEEN DESIGNED FOR USE IN NORMAL VEHICLE MAINTENANCE APPLICATIONS. A SPECIFIC INDIVIDUAL WARRANTY MUST BE ISSUED FOR UNITS THAT DEVIATE FROM INTENDED USAGE, SUCH AS HIGH CYCLE USAGE IN INDUSTRIAL APPLICATIONS, OR USAGE IN EXTREMELY ABUSIVE ENVIRONMENTS. MOHAWK RESERVES THE RIGHT TO DECLINE RESPONSIBILITY WHEN REPAIRS OR MODIFICATIONS HAVE BEEN MADE OR ATTEMPTED BY OTHERS WITHOUT WRITTEN AUTHORIZATION FROM MOHAWK RESOURCES LTD. THIS WARRANTY DOES NOT COVER LABOR OR TRANSPORTATION. THIS WARRANTY DOES NOT COVER DOWNTIME EXPENSES INCURRED WHEN UNIT IS IN REPAIR. THE LIFT MUST BE REGISTERED WITHIN 30 DAYS OF INSTALLATION BY MAILING SUPPLIED WARRANTY REGISTRATION CARD TO MOHAWK AND MUST BE SIGNED BY A LICENSED ELECTRICIAN. THE MODEL NUMBER AND SERIAL NUMBER OF THE EQUIPMENT MUST BE FURNISHED WITH ALL WARRANTY CLAIMS. THIS WARRANTY STATEMENT CONTAINS THE ENTIRE AGREEMENT BETWEEN MOHAWK RESOURCES LTD. AND THE PURCHASER UNLESS OTHERWISE SPECIFICALLY EXPRESSED IN WRITING. THIS NON-TRANSFERABLE WARRANTY APPLIES TO THE ORIGINAL PURCHASER ONLY.

THIS WARRANTY DOES NOT COVER NORMAL SURFACE WEAR ITEMS, ITEMS SUBJECT TO ABRASION, OR ITEMS USED IN A CORROSIVE ENVIRONMENT. SOME ITEMS ON LIFT ARE SUBJECT TO NORMAL “WEAR AND TEAR” AND ARE NOT COVERED UNDER THIS WARRANTY.

STRUCTURAL AND MECHANICAL COMPONENTS (ALL LIFTS):
STRUCTURAL AND MECHANICAL COMPONENTS OF THIS UNIT ARE GUARANTEED FOR THE BELOW STATED TIME FRAME, SPECIFIC TO MODEL LISTED, FROM THE DATE OF SHIPMENT FROM FACTORY, AGAINST DEFECTS IN WORKMANSHIP AND/OR MATERIALS WHEN LIFT IS INSTALLED AND USED ACCORDING TO SPECIFICATIONS.

25-YEARS STRUCTURAL / 10 YEARS MECHANICAL: TWO-POST MODELS A-7, SYSTEM IA-10, LC-12, LMF-12, TP-16, TP-18, TP-20, TP-26, TP-30. STRUCTURAL ITEMS COVERED INCLUDE LEG, CARRIAGE, SWING ARM AND SLIDER WELDMENTS (EXCLUDING NORMAL WEAR AREAS AS STATED ABOVE). MECHANICAL ITEMS COVERED INCLUDE ROLLER BEARINGS AND LIFTING CHAIN.

5-YEAR: MODELS TL-7.
2-YEAR: MODELS PARALLELOGRAM SERIES LIFTS.
1-YEAR: MODELS TD-1000, TD-2000, CT-1000, USL-6000.

POWER UNIT (ALL LIFTS):
ALL POWER UNIT COMPONENTS (MOTOR, PUMP AND RESERVOIR) ARE GUARANTEED FOR TWO YEARS FOR PARTS, FROM THE DATE OF SHIPMENT FROM FACTORY, AGAINST DEFECTS IN WORKMANSHIP AND/OR MATERIALS WHEN THE LIFT IS INSTALLED, WIRED BY A LICENSED ELECTRICIAN AND USED ACCORDING TO SPECIFICATIONS.

ELECTRICAL COMPONENTS (ALL LIFTS):
ALL ELECTRICAL COMPONENTS (EXCLUDING MOTOR) ARE GUARANTEED FOR ONE YEAR FOR PARTS, FROM THE DATE OF SHIPMENT FROM FACTORY, AGAINST DEFECTS IN WORKMANSHIP AND/OR MATERIALS WHEN THE LIFT IS INSTALLED AND USED ACCORDING TO SPECIFICATIONS. SEE WARRANTY EXCEPTIONS SECTION FOR BATTERIES.

PNEUMATIC-AIR COMPONENTS (ALL LIFTS):
ALL PNEUMATIC (AIR) COMPONENTS (I.E. AIR CYLINDERS AND POPPET AIR VALVES) ARE GUARANTEED FOR ONE YEAR FOR PARTS, FROM THE DATE OF SHIPMENT FROM FACTORY, AGAINST DEFECTS IN WORKMANSHIP AND/OR MATERIALS WHEN THE LIFT IS INSTALLED AND USED ACCORDING TO SPECIFICATIONS. COMPONENTS IN A PNEUMATIC SYSTEM THAT ARE NOT PROPERLY REGULATED, LUBRICATED AND CONDITIONED WITH AN AIR DRYING SYSTEM ARE NOT COVERED UNDER WARRANTY.

HYDRAULIC COMPONENTS (ALL LIFTS):
EXCLUDING CYLINDERS AND PUMPS (COVERED IN OTHER SECTIONS), ALL HYDRAULIC COMPONENTS (I.E. VALVES AND FITTINGS) ARE GUARANTEED FOR ONE YEAR FOR PARTS, FROM THE DATE OF SHIPMENT FROM FACTORY, AGAINST DEFECTS IN WORKMANSHIP AND/OR MATERIALS WHEN THE LIFT IS INSTALLED AND USED ACCORDING TO SPECIFICATIONS.
HYDRAULIC CYLINDERS (MODEL SPECIFIC LIFTS):
The following models are guaranteed for 5 years (parts only), from date of shipment from factory, for hydraulic cylinders, against defects in workmanship and/or materials when the lift is installed and used according to specifications: Two-post models A-7, System IA-10, LC-12, LMF-12, TP-16, TP-18, TP-20, TP-26, TP-30.

All other models are guaranteed for two years (parts only), from the date of shipment from factory, for hydraulic cylinders, against defects in workmanship and/or materials when the lift is installed and used according to specifications (excluding USL-6000, which is one year).

The “EXTENDED LIFETIME CYLINDER SEAL WARRANTY” (below) is applicable to the following Mohawk lifts only: Two-post models A-7, System IA-10, LC-12, LMF-12, TP-16, TP-18, TP-20, TP-26, TP-30. See Mohawk’s “EXTENDED LIFETIME CYLINDER SEAL WARRANTY” for specific warranty provisions for hydraulic cylinders.

THE “EXTENDED LIFETIME CYLINDER SEAL WARRANTY” is as follows:

As the original purchaser of a Mohawk lift manufactured by Mohawk Resources, Ltd. you are entitled to an extended cylinder seal warranty.

Mohawk’s obligation under this warranty is limited to supplying model specific cylinder seals. The customer is responsible for shipping and handling of the seals. Mohawk is not responsible/liable for the rebuild of cylinders by others. This warranty is non-transferable and runs to the original purchaser only.

STANDARD OPTIONS (ALL LIFTS):
All standard options of this unit are guaranteed for one year for parts, from the date of shipment from factory, against defects in workmanship and/or materials when lift is installed and used according to specifications.

CUSTOM LIFTS AND CUSTOM OPTIONS:
All “custom” lifts and/or “custom” options are guaranteed for one year for parts, from the date of shipment from factory, against defects in workmanship and/or materials when lift is installed and used according to specifications.

WARRANTY EXCEPTIONS (ALL LIFTS):
ADJUSTMENTS: This warranty does not cover casual and routine adjustments such as, but not limited to: fittings, sensors and switches, anchor bolt re-tightening, or any shimming or adjustments required during a proper and professional installation by a qualified installer.

MAINTENANCE AND INSPECTIONS: If this unit is not maintained and inspected in accordance to the relevant sections in the users manual for this specific model, warranty is void. OSHA, ANSI and Mohawk require that records must be maintained to prove that inspections and maintenance of this unit have been routinely performed by qualified individuals.

ABUSE: If this unit is found to be overloaded (purposely or unknowingly), used in a situation beyond its intended function, not maintained & inspected regularly, used in an abusive environment or beyond normal shop usage, this warranty is void in its entirety.

NON-EXISTENT PROBLEMS: For service visits, part replacements, labor, etc. for parts found to be non-defective, or for a unit dis-function that does not exist, it is the lift owner that requested the service visit who bears the responsibility of all related expenses.

BATTERIES: All batteries carry the battery manufacturer’s warranty. Maintenance requirements and abuse provisions are as stated by the battery manufacturer. Refer to battery manufacturer’s warranty.

SPECIAL/MODIFIED INSTALLATIONS: This warranty does not cover “non-traditional” installations. Installations are to be done according to specifications, or the warranty is void.

WEARABLE COMPONENTS: Some items on lifts are subject to normal “wear and tear” and are not covered under this warranty.

* THIS WARRANTY SUPERSEDES ALL OTHER WARRANTY POLICIES PREVIOUSLY STATED AND IN ALL OTHER MOHAWK PRODUCT SPECIFIC LITERATURE (MANUALS, BROCHURES, ETC.).

### OPTIONS

All information, illustrations, and specifications in this manual are based on the latest product information available at the time of printing. We reserve the right to make changes at any time without notice.
GENERAL NOTES & WARNINGS

RECOMMENDATIONS BY THE INDIVIDUAL USER OR USING ORGANIZATION FOR IMPROVING THIS PUBLICATION OR ANY ASPECT OF THE PRODUCT ARE ENCOURAGED AND SHOULD BE FORWARDED IN WRITING TO:

MOHAWK RESOURCES LTD, SERVICE DEPT, 65 VROOMAN AVENUE, AMSTERDAM, NY 12010

THIS IS NOT A VEHICLE LIFTING PROCEDURE MANUAL AND NO ATTEMPT IS MADE OR IMPLIED HEREIN TO INSTRUCT THE USER IN LIFTING METHODS PARTICULARLY TO THE INDIVIDUAL APPLICATION OF THE EQUIPMENT DESCRIBED IN THIS MANUAL. RATHER, THE CONTENTS OF THIS MANUAL ARE INTENDED AS A BASE LINE FOR OPERATION, MAINTENANCE, TROUBLESHOOTING, AND PARTS LISTING OF THE UNIT AS IT STANDS ALONE AND AS IT IS INTENDED AND ANTICIPATED TO BE USED IN CONJUNCTION WITH OTHER EQUIPMENT.

PROPER APPLICATION OF THE EQUIPMENT DESCRIBED HEREIN IS LIMITED TO THE PARAMETERS DETAILED IN THE SPECIFICATIONS AND THE USES SET FORTH IN THE DESCRIPTIVE PASSAGES. ANY OTHER PROPOSED APPLICATION OF THIS EQUIPMENT SHOULD BE DOCUMENTED AND SUBMITTED IN WRITING TO MOHAWK RESOURCES LTD. FOR EXAMINATION. THE USER ASSUMES FULL RESPONSIBILITY FOR ANY EQUIPMENT DAMAGE, PERSONAL INJURY, OR ALTERATION OF THE EQUIPMENT DESCRIBED IN THIS MANUAL OR ANY SUBSEQUENT DAMAGES.

DO NOT WELD, APPLY HEAT, OR MODIFY THIS EQUIPMENT IN ANY MANNER WITHOUT WRITTEN AUTHORIZATION FROM MOHAWK RESOURCES LTD. CERTAIN ALLOY OR HEAT-TREATED COMPONENTS MAY BE DISTORTED OR WEAKENED, RESULTING IN AN UNSAFE CONDITION. MOHAWK RESOURCES LTD. IS NOT RESPONSIBLE FOR DISTORTIONS, WHICH RESULT FROM WELDING ON THIS EQUIPMENT AFTER MANUFACTURING IS COMPLETED, UNAUTHORIZED WELDING, APPLICATION OF HEAT, OR MODIFICATION OF THIS EQUIPMENT VOIDS ANY AND / OR ALL APPLICABLE WARRANTIES COVERING THIS EQUIPMENT.

ALL WARRANTIES APPLICABLE TO THIS EQUIPMENT ARE CONTINGENT ON STRICT ADHERENCE TO THE MAINTENANCE SCHEDULES AND PROCEDURES IN THIS MANUAL.

KEEP ALL SHIELDS AND GUARDS IN PLACE. ENSURE ALL SAFETY MECHANISMS ARE OPERABLE. KEEP HANDS, FEET, AND CLOTHING AWAY FROM POWER-DRIVEN AND MOVING PARTS.

WARNING

DO NOT INSTALL THIS UNIT IN A PIT OR DEPRESSION DUE TO FIRE OR EXPLOSION RISK

IMPORTANT NOTE

A LEVEL FLOOR IS SUGGESTED FOR A PROPER INSTALLATION SITE AND WILL ENSURE LEVEL LIFTING. ANY MAJOR SLOPE CHANGES WILL AFFECT THE UNIT’S LEVEL LIFTING PERFORMANCE. IF A FLOOR IS OF QUESTIONABLE SLOPE, CONSIDER A SURVEY OF THE SIGHT AND / OR THE POSSIBILITY OF POURING A NEW LEVEL CONCRETE SLAB SECTION. SIMPLY STATED, FOR OPTIMUM LEVEL LIFTING, THE EQUIPMENT, AT BEST, CAN LIFT ONLY AS LEVEL AS THE FLOOR ON WHICH IT IS LOCATED... AND SHOULD NOT BE EXPECTED TO COMPENSATE FOR DRASTIC FLOOR SLOPE DIFFERENCES.

THIS EQUIPMENT MUST BE USED ON A LEVEL CONCRETE FLOOR WITH A MINIMUM THICKNESS OF 4-1/2” ON GRADE. THE CONCRETE MUST BE AGED AT LEAST (28) TWENTY EIGHT DAYS PRIOR TO INSTALLATION AND HAVE A MINIMUM COMPRESSIVE STRENGTH OF 3000 PSI. DO NOT USE THIS UNIT ON ANY ASPHALT SURFACE.

DO NOT USE THIS UNIT ON A SECOND FLOOR OR ANY GROUND FLOOR WITH A BASEMENT BENEATH WITHOUT WRITTEN AUTHORIZATION FROM THE BUILDING ARCHITECT.

CAUTION

THE EQUIPMENT DESCRIBED IN THIS MANUAL COULD BE POTENTIALLY DANGEROUS IF IMPROPERLY OR CARELESSLY OPERATED. FOR THE PROTECTION OF ALL PERSONS AND EQUIPMENT, ONLY COMPETENTLY TRAINED OPERATORS WHO ARE CRITICALLY AWARE OF THE PROPER OPERATING PROCEDURES, POTENTIAL DANGERS, AND SPECIFIC APPLICATION OF THIS EQUIPMENT SHOULD BE ALLOWED TO TOUCH THE CONTROLS AT ANY TIME.

SAFE OPERATION OF THIS EQUIPMENT IS DEPENDENT ON USE, IN COMPLIANCE WITH THE OPERATION PROCEDURES OUTLINED IN THIS MANUAL ALONG WITH THE MAINTENANCE AND INSPECTION PROCEDURES WITH CONSIDERATION OF PREVAILING CONDITIONS.

THIS LIFT IS DESIGNED AND INTENDED FOR USAGE AND STORAGE INDOORS ONLY. MOHAWK DENIES ALL LIABILITY AND VOIDS WARRANTY IN SITUATIONS WHERE THIS LIFT IS USED OR STORED WHERE IT IS SUBJECTED TO THE OUTDOOR ELEMENTS AND TEMPERATURES.

THE EQUIPMENT DESCRIBED IN THIS MANUAL IS NEITHER DESIGNED NOR INTENDED FOR ANY APPLICATION ALONE OR IN CONJUNCTION WITH ANY OTHER EQUIPMENT THAT INVOLVES THE LIFTING OR MOVING OF PERSONS.

ALWAYS CONSULT THE VEHICLE LIFTING GUIDE FOR THE PROPER LIFTING POINTS ON ANY VEHICLE. THESE GUIDES ARE AVAILABLE FROM THE VEHICLE MANUFACTURERS. ALSO, REFER TO THE ANSI STANDARD “VEHICLE LIFT POINTS FOR SERVICE GARAGE LIFTING,” ANSIUSAE J2184-OCT92, SAFETY MANUAL “LIFTING IF RIGHT,” ALI/SM01, AND “VEHICLE LIFTING POINTS GUIDE” ALI/LP-GUIDE FOR PROPER POSITIONING OF VEHICLES ON LIFT.

AFTER LIFTING THE VEHICLE TO THE DESIRED HEIGHT, ALWAYS LOWER THE UNIT ONTO THE MECHANICAL SAFETIES. THE FORMING OF GOOD OPERATIONAL WORK HABITS WILL ELIMINATE OVERSIGHTS IN THE USE OF PROVIDED SAFETY DEVICES.
APPENDAGE:
Rev (9/1/2012)

LIFT ENVIRONMENT LIMITATIONS:
Mohawk prohibits the outdoor installation of this standard lift, which is APPROVED FOR INDOOR USAGE ONLY, in a normal garage type environment. Any concerns in applications that expose the lift to additional environmental effects, such as paint booths, wash bays, outdoors, high or low temperatures, etc. must be addressed to our engineering department, where provisions could/may be made to the lift to accommodate the area of use. Our engineering department must be made aware in advance of these conditions and any additional code requirements that must be met.

Also, the foundation for which this lift must be installed on must comply to the minimum specifications as set forth in this manual. Any drainage slopes in the bay where the lift is to be installed must be directed away from the posts to prevent water accumulation at the post bases.

Standard floor requirements are contained within this manual. For installation within a seismic area, a qualified person must be consulted to address seismic loads and other local or state requirements.

LOCKOUT/TAGOUT REQUIREMENTS:
The start switch provided with this unit must not be used as a primary disconnecting means. A separate disconnecting means must be provided in accordance with all applicable codes. It is the responsibility of the owner/user of this unit to provide a proper lockout/tagout device for this unit before or during installation in conformance to ANSI Z244.1 and any local/state/national electrical codes and any OSHA regulations.

OTHER LIFT LIMITATIONS:
All Mohawk MP-Series lifts must accomplish three main criteria in order to lift a vehicle safely:

1. **Proper capacity.** All MP-Series lifts are designed to lift standard vehicles within their rated capacity within the capacity of the lift rating. Any vehicles exceeding the capacity must not be raised. Ensure that individual columns are used within their capacity and are not overloaded (i.e. heavy ended vehicles may overload the rear pair of columns).

2. **Proper engagement of tires/frame:** ensure tires are fully engaging all tires or proper frame components of vehicle. Ensure frame components used are capable of supporting vehicle.

3. **Proper flooring.** Use lifts on floors complying to required specs stated within this manual.

This lift is not intended to be driven on or off of, as this may damage the lift and the vehicle.

This lift is not intended for the lifting of people.

Care must be observed when removing any heavy components from a vehicle and thereby drastically shifting the vehicle center of gravity (i.e. engine removal, transmission removal, etc.). The use of jack stands at the front and rear ends of the vehicle is highly recommended when performing this type of work.

File: MP-Appen.doc
POWER SUPPLY REQUIREMENTS (AC Units)

IMPORTANT:
It is the user's responsibility to provide all wiring for electrical hook-up prior to installation and to insure that the electrical installation conforms to local building codes. Where required, it is the user's responsibility to provide an electrical isolation switch (per lockout/tag-out requirements stated in ANSI Z244.1) located in close proximity to the lift that will enable emergency stop capability and isolate electrical power from the lift for any servicing requirements.

The power supply connection must comply with the following.

For VAC Units, Disconnectable Cable Power Feed to Lift:
If using a plug with the flexible cable connection provided, a plug must be provided that is rated as shown in the table below for the particular model, voltage and phase of the equipment supplied. This plug must be of the NEMA locking type with a ground connection and must have UL, CSA or other equivalent listing. Consult the plug manufacturer’s installation instructions for connecting the plug to the cable. Refer to the electrical schematics in this manual for the proper connection of the power supply to the lift. Refer below to wire color designations and proper selection of feed cable. Consult and adhere to all local and national codes applying to the installation and use of this product.

VAC Wire Color Designations:

<table>
<thead>
<tr>
<th>3 Phase (Standard):</th>
<th>1 Phase (Optional):</th>
</tr>
</thead>
<tbody>
<tr>
<td>Red: L1 (X)</td>
<td>Red: L1 (X)</td>
</tr>
<tr>
<td>Black: L2 (Y)</td>
<td>Black: L2 (Y)</td>
</tr>
<tr>
<td>White: L3 (W)</td>
<td>White: Not Used (W)</td>
</tr>
<tr>
<td>Green: Ground (G)</td>
<td>Green: Ground (G)</td>
</tr>
</tbody>
</table>

VAC Required Cable Specification:
All power feed cable to this lift must be of Type SO, SOOW, or SOW, rated 600 V, 90 Degree C. The maximum length of the main power feed cable and inter-connection means (plugs) must not exceed 30 feet from the main post to the power feed box. The plug must be provided that is rated as shown in the table below for the particular model, voltage and phase of the equipment supplied.
POWER SUPPLY REQUIREMENTS (DC Units)

This lift comes with (2) 12 VDC batteries in series to provide a 24 VDC system. A separate 120 VAC power supply is only required when charging the post. Each post comes equipped with a 120 VAC, 60 HZ receptacle which accepts a 120 VAC extension cord. The minimum amp draw is 3 amps per post. Use sizes of plug, cord and power supply as follows:

Plug Requirements:
NEMA Type 5-15 (Female), 125 VAC, 2 Pole, 3 Wire Grounding, 15 Amp Rated.

Cord Requirements:
3 Wire, 125 VAC, 15 Amp Rated, Oil Resistant, Type G, SO, STO, or W. (Maximum Length is 50 feet)

Power Requirements:
115-120 VAC, 2 Pole, 3 Wire Grounding, 60 Hz, 3 Amps minimum per post. Size circuit breaker to NEC and local codes.

WARNING: Keep in mind that branching extension cords between posts will multiply the amp draw.
(i.e. 6 posts will collectively draw 18 amps).

NOTE THAT THESE POSTS WILL NOT OPERATE AND CHARGE AT THE SAME TIME. REMOVE THE POWER LEADS TO THE CHARGER RECEPTACLE PRIOR TO LIFT USAGE.
OPTIONAL EQUIPMENT

Note: Refer to Option Equipment Section in the back of this manual for specific user instructions for option available for this lift.

The standard mobile lift is suitable to lift wheeled vehicles by the tires. It normally comes in pairs of columns totaling 2, 4, 6 or 8 column systems. Ordering additional dummy plugs and power cables (if AC) may enable one lift to be used in a variety of combinations simultaneously.

A hand control pendant is available and can be connected to any column.

For AC models, the standard power supply requirements for the MP-18 series mobile lifts is 208-230 VAC, 3 phase. Optional power supply configurations of 208-230 VAC, Single Phase or 480 VAC, 3 Phase or 575 VAC, 3 Phase are available upon request. Note: Refer to Power Supply Requirements section in this manual for availability with respect to post configurations.

If it is desired to raise the vehicle by the frame, this can be done by using optional chassis lifting beams or optional frame contact adapters. The chassis lift beam fits into the cradle where the tire would normally fit and spans between a pair of columns. Frame contact adapters convert a pair of mobile lift columns into a 2-column frame engaging lift. Refer to the ANSI standard “Vehicle Lift Points for Service Garage Lifting,” ANSI/SAE J2184-Oct92, safety manual “Lifting if Right,” ALI/SM01, and “Vehicle Lifting Points Guide” ALI/LP-Guide for proper positioning of vehicles on lift.

If it is desired to raise fork trucks, a fork truck adapter kit is available, which converts a pair of mobile lift columns into a 2-column pad engaging lift.

For lifting applications involving side wing plows or RV’s with side extensions, where the forks of the mobile lifts can not reach to the tires, wing plow adapters are available. These adapters span between a pair of columns to achieve engagement of the tires in the same manner of the column forks.

For lifting of vehicles with dual tires, floatation tires, or “super singles”, longer forks are available. Note that the longer fork lifts have reduced capacity.

Jack Stands are also available that support the vehicle in the raised position for maintenance or to permit using the lift for other vehicles.

NOTE:
The use of any adapters on this lift may reduce the capacity of this lift. Refer to the capacities of the adapters used.

WARNING!
Use only options manufactured by MOHAWK RESOURCES LTD with this lift. Options manufactured by others and used on this lift may result in bodily harm, damage to lift and other equipment, and will void lift warranty, Mohawk Resources Ltd liability, and the ALI certification of the lift.
MP-18 SERIES POST SPECIFICATIONS:

- **Capacity:** 18,000 LB each
- **Stroke:** 67 INCHES
- **Lifting Speed:** 67 SECONDS

DESIGN AND CONSTRUCTION

The standard mobile lift is suitable to lift wheeled vehicles by the tires. It normally comes in pairs of columns totaling 2, 4, 6 or 8 column systems. Each column consists of a rigid frame of three-wheel design for maneuverability, lifting carriages with tire forks, control panel, electric-hydraulic power unit, and hydraulic cylinder.

Two of the wheels are spring loaded and in fixed positions on the column base. The third wheel is steerable and hydraulically operated, permitting movement of the unloaded columns, but allowing the column to sit firmly on the floor before a load is applied.

For DC Models that use battery power, each post is identical except for post identification (Post ID), and each has communication outlets to attach to the other posts, forming configurations from 2 posts all the way up to 8 posts (see lift setup).

For AC Models, any single Master Column (#1, #3, #5 or #7) accepts the incoming electrical supply to the Master Column Panel and has electrical outlets for the remaining columns. Only one incoming power supply is to be used.

When the lift is raised or lowered in the “synchronized” mode the actual movement of each carriage is counted by each post’s PLC (programmed logic controller). If the movement of any carriage exceeds that of any other carriage in the system, the carriage is slowed down or stopped until the others catch up.

Each post houses the same controls, enabling the user to control the whole lift, a single post or a post-pair combo at any post desired. Post Pairs are designated as Post #1&2, #3&4, #5&6 and #7&8, regardless of where they are physically placed in the system.

A hydraulic cylinder, powered by an electric-hydraulic pump unit, controls the carriage movement. There is an internal relief valve on the pump unit, which prevents overloading of the carriage.

A separate automatically engaging back-up mechanical safety lock latch prevents lowering of the carriage in the event of failure of the hydraulic system.

All movement controls are of the “vigilance control” type which are operable only as long as the operator is depressing the button. As soon as the button is released the command for motion will stop.

All columns have controls for synchronized or individual column movement, plus an “Emergency Stop”.

Depressing the Emergency Stop button will stop all columns immediately and will not permit any column movement until the depressed button is reset.
MOBILE LIFT SET-UP

THOROUGHLY READ THIS SECTION BEFORE OPERATING THE LIFT. IF YOU HAVE ANY QUESTIONS GET THEM ANSWERED BEFORE PROCEEDING. REFER TO ANSI/ALI ALIS “SAFETY REQUIREMENTS FOR INSTALLATION AND SERVICE OF AUTOMOTIVE LIFTS.”

1. Be sure that the floor is strong enough to support the lift before operating. Do not use the lift on asphalt surfaces, as the lift will sink (cause depressions in the asphalt) if the vehicle is on the lift for any extended period of time. Minimum recommended flooring is 4 ½” thick concrete with 3000 psi compressive strength on grade.

   If it is necessary to use the lift on an asphalt surface, it is recommended to use a steel plate, a minimum thickness of 3/8” (8mm) which extends a minimum of 6” on all sides beyond the support points of the base of the lift. This will minimize sinking effect if the vehicle is raised for an extended period of time.

2. Be sure that the surface of the floor is relatively flat. If there is a slope of more than 3 degrees (1 inch decline over 20”) do not operate the lift. Relocate to a flatter surface.

3. Verify adequate ceiling clearance to raise the vehicle without the top of the vehicle coming in contact with any obstruction. If necessary, measure the lowest point to determine how high you can raise the vehicle. Minimum height required is tallest vehicle height plus 67”.

4. Drive the vehicle to the working spot. Do not drive the vehicle over the cables of the lift. The cables should be arranged in a “U” shape around the entry of the vehicle or the cables should be disconnected and stored before moving the vehicle.

5. Ensure posts pairs are opposite each other at each axle (Post Pairs are 1&2, 3&4, 5&6, 7&8). Push the cradle forks of each post around each tire. Be sure to push them in as far as possible. The wheel rim should be larger than the opening in between the forks. The posts should be centered with the tires, avoiding any offset loading of the posts. See figure below. Ensure that fork pins are placed in holes at fork tubes.

---

![Diagram: Always Shift Forks Against Each Tire Before Lifting](PT. #01-300-208)
6. Press the release lever to lower all jacking wheels on back of all posts after positioning.

7. Connect the communication cables from post to post in a daisy-chain fashion. For example: Posts 1 to 3 to 4 to 2 for a 4-post setup. Place dummy plugs (one red and one yellow if AC unit) at the posts at the end of the chain. (See figure below) Note: this lift will not power up or function properly unless all communication cables and both dummy plugs are connected.

---

**MP-SERIES POST CONFIGURATIONS**
MOST COMMONLY USED COMBINATIONS SHOWN
OTHER COMBINATIONS AVAILABLE (REFER TO USER MANUAL)

<table>
<thead>
<tr>
<th>2-POST CONFIGURATION</th>
<th>4-POST CONFIGURATION</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Diagram" /></td>
<td><img src="image2" alt="Diagram" /></td>
</tr>
</tbody>
</table>

**WARNING!**
FAILURE TO SETUP AND CONNECT POSTS AS SHOWN ABOVE MAY RESULT IN BODILY INJURY AND/OR DAMAGE TO EQUIPMENT.

**NOTES:**
1. CONNECT ALL COMMUNICATION CABLES, DUMMY PLUGS, AND POWER CABLES AS SHOWN ABOVE FOR THE CONFIGURATION USED.
2. ENSURE THAT ALL CONNECTIONS ARE SECURE AND LATCHED.
3. PAIRED COLUMNS WILL ALWAYS ACT AS PAIRS, REGARDLESS OF WHERE THEY ARE LOCATED WITHIN THE SYSTEM. PAIR COMBINATIONS ARE AS FOLLOWS:
   - POST #1 & #2
   - POST #3 & #4
   - POST #5 & #6
   - POST #7 & #8
4. CONSULT MANUAL FOR SETUP AND CONNECTIONS FOR 8-POST CONFIGURATION.

---

8. IF AC Lift, connect the power cable to the appropriate master column. (See figure above)

9. IF DC, unplug all power leads to chargers on all posts.

---

P/N #601-300-19B
MOBILE LIFT OPERATION

1. Perform Lift Setup as stated in previous section.

2. Disengage all E-STOP buttons at each post by turning them clockwise to release them. If AC Lift, turn on the main switch to the lift at the powered column (column that has the main power cable connected to it). If DC Lift, each individual lift column will need to be turned on.

3. Notice that the displays will indicate which posts are communicating in the system. Verify this configuration to continue operation. The system is now ready to operate.

4. SINGLE WHEEL OPERATION
   Go to each wheel and engage each tire with the forks. To raise only a single wheel, turn the selector switch to SINGLE at the post that control is desired, while pressing the RAISE button. The SINGLE operation is to be used only to initially engage the tires and for slight equalization adjustments.

   During lift operation, is single wheel lifting, lowering or parking is desired, turn the selector switch to SINGLE at the post that control is desired, while pressing the RAISE button. BE VERY CAREFUL WHEN DOING THIS OPERATION THAT THE VEHICLE REMAINS STABLE AND THAT THE SIDE OF THE VEHICLE DOES NOT COME IN CONTACT WITH THE COLUMN.

   NOTE: If the SINGLE switch is released while the UP or DOWN button is still pressed the hoist will operate in default ALL synchronized mode (All posts will be controlled).

5. RAISING ALL WHEELS
   This lift controls default to controlling ALL the columns in the system (selector switch is spring returned to ALL). Press the RAISE button to raise the lift. Keep the pressure on the button until the vehicle is raised to the desired position. If necessary, use a second person to observe the area not seen by the operator.

6. PARKING ALL WHEELS (ON MECHANICAL LOCKS)
   This lift controls default to controlling ALL the columns in the system. Press the PARK button to lower the lift onto the mechanical locks. Keep the pressure on the button until the vehicle is completely lowered onto the locks. If necessary, use a second person to observe the area not seen by the operator.

7. LOWERING ALL WHEELS
   This lift controls default to controlling ALL the columns in the system. Press the LOWER button to lower the lift. Keep the pressure on the button until the vehicle is lowered to the desired position. If necessary, use a second person to observe the area not seen by the operator.

   NOTE: If lift in park position (on mechanical locks), you will have to raise lift off of locks first, then lower. Lift will not automatically rise off of lock when pressing lower.
NOTE: IF FOR ANY REASON, THE LIFT BECOMES INOPERATIVE IN THE RAISED POSITION WITH A VEHICLE ON IT, CONTACT YOUR LOCAL MOHAWK REPRESENTATIVE OR THE MOHAWK FACTORY.

8. **PAIR OPERATION**
   To raise, lower or park only a pair of wheels, turn the selector switch to PAIR at the post pair that control is desired, while pressing the RAISE, LOWER or PARK button.

   **NOTE:** Be sure that the set of wheels on the ground is free to move as the effective distance between the front and rear wheels becomes less as one pair of wheels is higher or lower than the other pair. Keep the height difference between pairs as low as practical.

   **NOTE:** If the PAIR switch is released while the UP or DOWN button is still pressed the hoist will operate in default ALL synchronized mode (All posts will be controlled).

9. **RESET OPERATION (if needed)**
   To re-establish a respective post-to-post synchronized state of the lift (whether all carriages are perfectly level with each other or not), press and hold the RESET button for 15 seconds. The system will then think that all posts are level with each other in the relative state that they are in. This feature is often used after major SINGLE and PAIR operations have altered the synchronized state and the user wishes to re-establish level condition. This feature is also used to turn off faults.

**LIFTING EXAMPLE:**
Now that all the setup and operations instructions have been presented, an example of a typical lifting application is shown using an DC unit:

A mechanic is to perform maintenance on a school bus. He drives the vehicle into the bay. He then unplugs any power cables to the charger inlets on all of the posts to be used. He jacks each post with the pallet jack and moves them to each of the tires in the post configuration shown in the setup diagram. Pushing the posts firmly against the tires, he checks to ensure that the forks are slid inward as far as possible to engage the tires. He presses the pallet jack release on each column. He then connects the communication cables and dummy plugs to all the posts as shown in the setup diagram.

He is now ready to use the lift. He turns the main switch to “Operate Lift” and releases the E-Stop Button on each post of the system. Once this is done, all the displays should illuminate. He reads the post communication screen to verify that all the columns are present and accounted for on the display. He presses the appropriate button on the screen to verify the post set-up. The lift system is now ready to operate.

The mechanic then goes to each post and presses UP and SINGLE for a short moment to engage each tire with the forks until the spring loaded wheels of the post retract and the post feet are flattened on the floor. (The SINGLE function is to be used for slight adjustments and to initially engage the tires ONLY). The mechanic then presses UP and raises the vehicle to the desired height. Then the PARK button is pressed and held until the vehicle stops on the mechanical locks.

The mechanic is now able to work on the vehicle. Once done, he presses UP to lift the vehicle off of the mechanical locks. The DOWN button is pressed to lower the lift to the ground. If any adjustments where made (like SINGLE or PAIR) which made the lift level vary from the floor level, the lift may experience a fault when lowered to the floor. Pressing RESET will clear this fault and allow further lowering. Also, reversing the adjustments by pressing SINGLE or PAIR will allow the user to lower the lift fully to the floor.

Once vehicle is fully lowered, cables are stored and posts are jacked up and pulled away.
LIFT FINAL CHECKOUT (AFTER INSTALLATION):
REV (9/1/2012)

THIS PROCEDURE OUTLINES THE FINAL CHECKS TO MAKE AFTER INITIAL INSTALLATION OF THE LIFT UNIT.
REPEAT THIS PROCEDURE IF THE LIFT IS RELOCATED.

AFTER THE LIFT IS FULLY ASSEMBLED, RAISE THE LIFT EMPTY A FEW TIMES TO VERIFY:

• PROPER POWER INPUT TO ALL POSTS (NOT APPLICABLE TO DC COLUMNS)
• PROPER COMMUNICATION OF ALL POSTS IN SYSTEM
• POST RECOGNITION OF ALL POSTS IN SYSTEM
• ALL POSTS RAISING SMOOTHLY AND ALL SYNCHRONIZED
• NO LEAKS PRESENT AT ANY FITTING JUNCTIONS
• LOCKS ARE ENGAGING ON ALL POSTS SIMULTANEOUSLY AS LIFT IS RAISING
• LOCKS ARE DIS-ENGAGING ON ALL POSTS WHEN LOWERING BUTTON DEPRESSED.
• LOCKS ARE RE-ENGAGING AFTER DIS-ENGAGED.
• LIFT IS NOT DRIFTING DOWN WHEN RAISED (RAISE LIFT, THEN STOP, AND VERIFY DRIFT DOWN OF CYLINDERS)
• NO VIBRATIONS FROM LOOSE CLAMPING, ETC.

ONCE THIS IS COMPLETE, LOCATE A REPRESENTATIVE VEHICLE INTO THE LIFTING AREA.
USE A VEHICLE THAT WEIGHS AT LEAST 50 PERCENT OF THE CAPACITY OF THE LIFT.
OBSERVING LIFTING PROCEDURES CONTAINED IN THIS MANUAL TO POSITION THE VEHICLE ONTO THE LIFT.

RAISE LIFT APPROXIMATELY 1 FOOT, VERIFY THE FOLLOWING:

• ALL POSTS RAISING SMOOTHLY AND ALL SYNCHRONIZED
• NO LEAKS PRESENT AT ANY FITTING JUNCTIONS
• LOCKS ARE ENGAGING ON ALL POSTS SIMULTANEOUSLY AS LIFT IS RAISING (SOME VARIANCE EXPECTED)
• LIFT IS NOT DRIFTING DOWN WHEN RAISED (RAISE LIFT, THEN STOP, AND VERIFY DRIFT DOWN OF CYLINDERS)
• NO VIBRATIONS FROM LOOSE CLAMPING, ETC.

PRESS PARK, VERIFY THE FOLLOWING:

• ALL POSTS LOWERING ONTO LOCKS

RAISE LIFT A FEW INCHES, THEN PRESS LOWER, VERIFY THE FOLLOWING:

• ALL POSTS LOWERING SMOOTHLY AND ALL SYNCHRONIZED
• NO LEAKS PRESENT AT ANY FITTING JUNCTIONS
• NO VIBRATIONS FROM LOOSE CLAMPING, ETC.
• LOCKS ARE NOT RE-ENGAGING WHILE LOWERING

RAISE LIFT TO FULL STROKE, VERIFY THE FOLLOWING:

• ALL POSTS RAISING SMOOTHLY AND ALL SYNCHRONIZED
• NO LEAKS PRESENT AT ANY FITTING JUNCTIONS
• LOCKS ARE ENGAGING ON ALL POSTS SIMULTANEOUSLY AS LIFT IS RAISING (SOME VARIANCE EXPECTED)
• LIFT IS NOT DRIFTING DOWN WHEN RAISED (RAISE LIFT, THEN STOP, AND VERIFY DRIFT DOWN OF CYLINDERS)
• NO VIBRATIONS FROM LOOSE CLAMPING, ETC.

LOWER LIFT ONTO LOCKS, VERIFY THE FOLLOWING:

• ALL LOCKS ARE ENGAGING UPON DESCENT
• PROPER SYNCHRONIZATION OF TRACKS

RAISE LIFT 3 INCHES, THEN LOWER VEHICLE TO FLOOR, VERIFY THE FOLLOWING:

• ALL POSTS LOWERING SMOOTHLY AND ALL SYNCHRONIZED
• NO LEAKS PRESENT AT ANY FITTING JUNCTIONS
• NO VIBRATIONS FROM LOOSE CLAMPING, ETC.
• LOCKS ARE NOT RE-ENGAGING WHILE LOWERING

ENSURE THAT ALL MANUALS AND OTHER INSTRUCTIONAL MATERIALS ARE DELIVERED TO OWNER/USER/EMPLOYER.
ENSURE THAT USERS ARE INSTRUCTED IN THE SAFE AND PROPER USER OF THE LIFT.

THIS ENDS THE FINAL CHECKOUT OF LIFT.

File: Final Checkout MP-Series.doc
AUTOMOTIVE LIFT SAFETY TIPS

Post these safety tips where they will be constant reminder to your lift operator. For information specification to the lift, always refer to the lift manufacturer’s manual

1. Inspects your lift daily. Never operates if it malfunctions or if it has broken or damaged parts. Repairs should be made with original equipment parts.
2. Operating controls are designed to close when released. Do not block open or override them.
3. Never overload your lift. Manufacturers rated capacity is shown on nameplate affixed to the lift.
4. Positioning of the vehicle and operation of the lift should be done only by trained and authorized personnel.
5. Never raise vehicle with anyone inside it. Customers or bystanders should not be in the lift. During operation.
6. Always keep lift area free of obstructions, grease, tools, trash and other debris.
7. Before driving vehicle in lift area, position arms and posts to provide unobstructed clearance. Do not hit or run over the lift arms, adapters, or axle supports. This could damage the lift or vehicle.
8. Load vehicle on lift carefully. Push the cradle forks of each post around each tire. Be sure to push them in as far as possible. The wheel rim should be larger than the opening in between the forks. The posts should be centered with the tires, avoiding any offset loading of the posts. Verify by raising lift until forks engage tires to ensure secure contact. Raise lift the desired working heights. CAUTION: if you are working under the vehicle, lift should be raised high enough for locking device to be engaged.
9. Note that with some vehicles, the removal (or installation) of components may cause a critical shift in the centre of gravity and results in raised vehicle instability. Refer to the vehicle manufacturer’s service manual for recommended procedures when vehicle components are removed.
10. Before lowering lift, be sure tool trays, stands, etc. are removed from under the vehicle. Release locking devices before attempting to lower lift.
11. Before removing vehicle from lift area, position lift arms and supports to provide and unobstructed exit (refer back to No. 7)

These “Safety Tips” along with “Lifting it Right” a general lift safety manual, are presented as an industry service by the Automotive Lift Institute. For more information on this topic, writes to ALI, PO Box 85, Cortland, NY 13045
MAINTENANCE INSTRUCTIONS

1. The channel sections where the carriage bearings ride against should be cleaned and lubricated twice a year (once every 6 months) using a light lubricant (WD-40). The channel sections where the slide blocks ride against should be cleaned and lubricated twice a year (once every 6 months) using a light lubricant (WD-40).

2. The main carriage bearings are factory lubricated and may require additional periodic lubrication. If additional lubrication is desired, it is recommended to use CAM2 – Multipurpose #2 Grease (Part No. 86035) or equivalent. Use approximately 2 oz. per bearing.

3. Weekly, or whenever the hoist is used after any extended down time, the power supply and communication cables should be checked to make sure that there are no nicks or cuts which may reduce or compromise the insulation. Use a de-greasing cleaner to clean all cables so they maintain their visibility (Ensure cables are disconnected when cleaning them and do not spray cleaner on end connections). Also, check visually the hydraulic line connections for leaks and tighten or repair as necessary.

4. The hydraulic fluid should be changed once every two years using new Dexron III ATF. Drain the reservoir tank only when the carriage is in the lowered position. Fill with 3.25 US gallons per reservoir.

5. Every three months check snap rings on wheels and carriage lock. Apply a light coating of lubricant to pins as needed (WD-40).

6. In case of electrical break down have qualified service personnel service the lift using only factory direct replacement parts.

7. Call your Distributor or Factory direct if you have any questions with regards to operating the lift or need of replacement parts.

NOTE:

ONLY TRAINED LIFT SERVICE PERSONNEL ARE PERMITTED TO REPLACE WORN OR BROKEN PARTS.

REPLACE FAULTY PARTS WITH GENUINE MOHAWK RESOURCES LTD. FACTORY DIRECT PARTS ONLY.
EXPLANATION OF ELECTRICAL SYSTEMS

AC Electrical Power System

There are two types of columns with this system, master and slave. The only difference between them is that the master columns allow main power entry and main power control. Once the power is fed to a master column, a low power 24 VAC signal is sent through the system to detect if the following conditions are met:

1. The main switch of the master column with the power cable connected is turned on.
2. All the communication cables are connected to all the columns in the system.
3. Both dummy plugs are connected at the ends of the system.

Once these conditions are met, the main power contactor at the powered master column is activated, allowing power distribution to all the columns in the system. Power is provided to all the PLCs (programmed logic controllers) in the system. Once the PLCs are powered, they “search” for each other, establishing a network for synchronizing and controlling the lift as a system.

DC Electrical Power System:

All columns in this system are identical and need to be connected and individually turned on to be active within a lift system. Power is derived from (2) 12 VDC batteries in series, providing 24 VDC for each post. No power is transmitted from column to column, only communication.

Each post also comes provided with its own dual bank battery charger. An outlet on the side of the box is provided to power the battery charger. Power must be removed from the battery charger outlet to allow usage of the column. If power is present at the battery charger outlet, the post will not turn on. This is to prevent using the lift while it is charging, which could potentially damage the batteries and the charger.
EXPLANATION OF TOUCHSCREEN COMPUTER SYSTEM

SYSTEM ACTIVATION:

With respect to controls, all posts on this system are identical (on AC posts, there are master or slave columns, only difference being power feed). After the posts are connected as described in the lift setup, the lift is ready to be activated. As each post is turned on, they “search” for each other, establishing a shared network for synchronizing and controlling the lift as a system. For an AC unit, it is only necessary to power up the powered column. For a DC unit, it is necessary to turn on each individual column in the system.

The first thing the user must do to operate the lift is to verify that the network is detecting the desired number of columns to use. Post presence will be affected by how many posts are connected in the system, if they are connected properly (see lift setup), if the dummy plugs are connected properly (see lift setup), and if they are turned on (to “Operate Lift”). Pressing “YES” will allow the user access to continue with the system usage.

Example Screen shows lift with 4 posts present in system, Post #1, #2, #3, and #4. Pressing “YES” will allow user to continue.
SYSTEM LOGIN:

After the post configuration is accepted, the Security Control screen will appear. The lift’s password mode may either be “ENABLED” or “DISABLED”, depending on Supervisor setup (described later in Supervisor Screens).

If it is displaying “ENABLED”, the user will need to enter a password, depending on the level of security they wish to access the lift system. If it is just a normal user, a user login would be required. If it is factory personell trying to access factory settings, a factory login would be required. Supervisors would have their own login as well. All levels of login will obtain access to lift controls, but may not provide the same level of access to setting menus. Once login is accepted, press the “GO TO MENU” or any lift operational controls to continue.

If the screen is displaying “DISABLED”, press the “GO TO MENU” or any lift operational controls to continue. No password is required.

MAIN MENU:

Once the Main Menu is obtained, the user has various options. The user may access Factory, Supervisor, Maintenance, or Weight Display screens, or access the Security Level screen again. Some may not be accessible without the proper level of login clearance (i.e. the Factory Setup menus are only accessible after a factory login).

To operate the lift, the user may either press “GO TO RUN SCREEN” or press any operation control (Up, Down, or Unlock) and the lift will begin operating, and produce the Run Screen.
OPERATION OF SYNCHRONIZED LIFTING OR LOWERING

Each PLC (programmable logic controller) is “addressed” which establishes its identity on the network. For example, post #1 has a PLC with address #1, etc. Once communication of the network of PLCs is established, each PLC senses control and position inputs from each other. Be aware that pairs are designated as post #1&2, post #3&4, post #5&6, and post #7&8, regardless of where they are physically placed in the system. Follow the setup diagram as shown on the lift column. (See Lift Setup)

The height of each carriage above floor level is measured by string potentiometers (see next section) and compared to the other carriages by the PLC network. During raising, if any one carriage position is higher than the lowest carriage, the higher (fastest) one slows down or stops to allow the lowest (slowest) one to catch up. During lowering, if any one carriage position is lower than the highest carriage, the lower one slows down or stops to allow the highest one to catch up. This is all done by shifting motor contactors and proportional solenoid valve.

When lifting in Pair or Single mode, relative counting is not done, resulting in the PLC’s seeing a “synchronized” state after this adjustment is made. There are limits on how far the lift will allow a Single post to raise/lower, and how far a Pair of posts can raise/lower relative to the rest of the system.

If you turn off the unit or press the Emergency Stop button, the computer position for each column is still retained and the columns will still maintain synchronized relative positions.

FUNCTION OF STRING POTENTIOMETER (String-Pot)

There is a string potentiometer (string-pot) mounted on the top of each column, and connected to each carriage, which senses the movement of the carriage. The string-pot sends an absolute analog (4-20mA) signal to the PLC as the string is pulled in and out of the sensor. This signal is absolute, which means that the lift will always know the height of the lift, even when powered off and on again. This signal is directly translated into height position and can be witnessed by viewing the “Height in Inches” on the RUN SCREEN. If raising or lowering is not possible, manually pulling the string-pot cable, while the unit is powered and displaying the RUN SCREEN, will enable you to see the height changes, verifying functionality of the potentiometer.
THE RUN SCREEN:

The RUN SCREEN displays a lot of information about the lift status.

Post #: Displays the post address of the viewed column.

“Locked” (If present): If seen on top right, verifies that there is no hydraulic load on the lift. It is either fully lowered or fully lowered on mechanical locks.

Battery Level Bars (on DC Units Only): Displays battery level of the individual 24 VDC column. Left Bar displays instantaneous voltage. Right Bar displays lowest batter level seen while running. When right bar is within yellow zone, lift is at a warning stage and should be charged. When right bar reaches red zone, lift will not operate until fully charged.

“Battery Level” (on DC Units Only): Displays the instantaneous voltage for the individual 24 VDC column.

“System Ready”: Will display errors/faults on this banner if present.

“Height in Inches”: Will display the current post height in inches.

“Post # XX Weight”: Will display the load on the viewed column only (+/- 5%).

“Total Weight ALL Posts”: Will display the total added load on all columns of the system (+/- 5%).

“NORMAL Speed ON/OFF”: Press to achieve normal lifting/lowering speed.

“SLOW Speed ON/OFF”: Press to achieve slower lifting/lowering speed.

“HELP”: Provides further information in the event of any errors or faults.

“RESET”: Will reset the current level state of the lift to override any out of level issues. Must be pressed for at least 5 seconds to activate.

“GO TO MENU SCREEEN”: Will send user back to MAIN MENU.
Weight Display Screen
This screen will display the weight on each post in the system and the total weight on the lift system. (Note the tolerance of +/- 5% in weights shown). This weight does not deduct the weight of added lift accessories or adapters, such as chassis lift beams.

Factory Setup Screens:
These screens only accessible when security mode entered as factory with factory password.

These screens allow the ability to alter and/or view factory settings, such as:
Post Capacity
Serial Number
Pressure Calibration / Linear Potentiometer Calibration
Maximum Height Limit
Out of Level Parameters
Battery Warning Levels
**Maintenance Screens:**
These screens are accessible only with Factory, Supervisor or Distributor clearance.
The first two screens provide service contact information, serial number, inspection dates and lift cycles.
The third screen and beyond provide alarm history information, providing information on the last 20 fault occurrences. There is also an I/O status screen which gives feedback on all buttons and input devices on the post to assist in troubleshooting.
Supervisor Screens:
These screens are accessible only with Supervisor or Factory clearance.

Within these screens, the Supervisor can setup various users with user names and passwords (up to 8 users). The 3rd setup screen allows the Supervisor to designate if the lift is to be used only with Passwords or in Free to use mode (without passwords). The lockout time can also be set. This is the time the lift can remain idle before a new password is needed to use it again. User maximum height can be set here as well can be set for a value less than the maximum lifting height (i.e. for low ceiling clearance).

From the 1st screen, the Supervisor can access the User Data, which will provide individual usage data for each user that is designated in the supervisor settings. This can be a very useful tool for tracking an individuals usage of the lift.
ERROR MESSAGES:
There are a variety of error messages that may display if certain situations arise. Most often, a “Locks Not Engaged” screen will show if the lift is raised and not lowered completely on the mechanical locks. Other errors would be witnessed on the RUN SCREEN in the red banner in the center of the screen. There might be more than one error occurring. If this is the case, the display of the errors will alternated in the red banner. In the event of an error/fault, pressing the HELP button on the screen will provide additional assistance on why the error/fault occurred and what can be done to correct it. See below for a sample of various errors and their help screens.
TROUBLE SHOOTING

START-UP (AC Units):

**Problem**: Upon power up, screen does not illuminate.

**Solution1**: Check to see that all communication cables are connected, dummy plugs are connected, all E-Stop buttons are released, power cable is connected, and main power switch is on at powered post.

**Solution2**: If Solution 1 does not produce results, have qualified electrician verify main power coming into system matches power requirements of lift. Check for tripped circuit breaker.

**Solution3**: If Solution 2 does not produce results, check for these items in the following order when lift power feed is unplugged. Check for tripped circuit breaker in powered master post, Verify 24 VDC power supply is powered in powered master post, Check for faulty 24 VDC relay of powered master post, Check for faulty coil in power contactor (large) in powered master post. Consult with qualified electrician.

**Solution4**: If Solution 3 does not produce results, check for Faulty E-Stops. Unplug power from system. Connect all communication cables, remove both dummy plugs, and release all E-Stop buttons. Verify continuity between pin 8 of one end of the system and pin 8 of the other end of the system. If continuity not present, probable faulty E-Stop in one of the posts or possible faulty communication cable. Remove posts from system to “home-in” on which post (or cable) is producing the problem.

**Solution5**: If Solution 4 does not produce results, check for Faulty communication cable. Verify continuity between pin 9 of one end of the system and pin 9 of the other end of the system. Verify continuity between pin 10 of one end of the system and pin 10 of the other end of the system. If continuity not present, possible faulty communication cable. Check each cable for pin to pin continuity.

**Problem**: Upon power up, after login, red bar on screen shows “incorrect power phase”

**Solution**: This is a power fault, which indicates that the power feed lines are reversed rotation. Have a qualified electrician reverse 2 lines of the incoming power to the lift.

**Problem**: Upon power up, red bar on screen shows “motor overload fault”

**Solution**: This is a motor overload fault, which indicates that the overload has tripped for the post that is blinking. Turn unit off and wait a minute or two until the overload resets itself automatically.
DURING OPERATION:

**Problem:** After power up, not all posts are not shown on activation screen.

**Solution1:** Verify that all posts in system are turned on to “Operate Lift”. (DC Lift)

**Solution2:** Check for proper communication cable and dummy plug connection of all posts. (See lift setup)

**Solution3:** Possible faulty communication cable or dummy plug. Consult Mohawk Service department.

**Problem:** Lift stops and red bar on screen shows message.

**Solution:** This indicates a fault. Press the “HELP” button on the screen for more information on a remedy and possible cause. Refer to ERROR MESSAGE section of this manual.

**Problem:** Lift jack not raising lift or lift jack not collapsing when loaded.

**Solution:** Lift jack relief valve needs to be adjusted. Turn relief set screw clockwise to increase lifting ability of jack. Turn relief set screw counter-clockwise to reduce lifting ability of jack. See illustration in back of manual.

**Problem:** There is more than 1-1/2” height difference between carriages.

**Solution:** This may be due to the fact that one column was operated on SINGLE before operating the unit in the ALL mode. This may also be due to operating in the PAIR mode before operating in ALL mode.

**Problem:** Carriage is lowering on its own.

**Solution1:** Check that there are no oil leaks by checking around the column. If so, repair the leak condition.

**Solution2:** If Solution 1 does no produce results, check for leakage of cylinder piston seals. Remove black plastic vent tube from power unit reservoir tank port and see if any fluid is flowing out. If so, cylinder piston seals are leaking. Contact Mohawk’s Service department.

**Solution3:** If Solution 2 does not produce results, the lowering valve(s), located on the power unit may have collected some dirt, preventing them from sealing properly. Make sure that the carriage is lowered to floor level in order that there is no pressure in the system. Disconnect the power so that no one can start the unit. You can now remove the lowering valve(s). Disconnect the electrical leads from the solenoid using a screwdriver to remove the screw holding the two mating connectors. Remove the lowering valve(s) from the power unit and check to see that there is no foreign material in the valve ends, which prevent the balls from sealing. Remove the foreign material. If you cannot find any problem, replacement of valve may be required. Contact Mohawk’s Service department.

**Problem:** Lift not raising load.
Solution 1: Lift may be overloaded. Verify weight on column by viewing screen. Remove weight if in excess of lift capacity.

Solution 2: Relief valve may be out of adjustment. Contact Mohawk Service dept.

MP-18-SERIES
ELECTRIC/HYDRAULIC
PORTABLE LIFT
Jack Operation:

Prior to moving posts, the rear jack wheels must be engaged. To do this, push black lever down, then jack handle to desired height. When post is in position, collapse jack wheel fully by pulling black lever up.

Jack Relief Adjustment:

If jack does not collapse under load or if jack does not raise back of post onto wheel, then the relief valve may need to be adjusted. To set proper jack capacity, lift empty post with jack, then remove relief port cap with 5mm allen wrench (see location to right). Using 5mm allen wrench SLOWLY turn adjustment screw counterclockwise until jack collapses. Then screw in clockwise 1 full turn. Replace port cap.
**WARNING**

Clear area if vehicle is in danger of falling.

**WARNING**

Remain clear of lift when raising or lowering vehicle.

**WARNING**

Locate lift on firm, level surface, preferably concrete.

**WARNING**

Be sure intended lifts are moving together evenly.

**WARNING**

All lifting forks must properly engage vehicle tires or supports.

**WARNING**

Do not drive over or pinch electrical cables.

**WARNING**

Keep feet clear of lift while lowering.

The messages and pictographs shown are generic in nature and are meant to generally represent hazards common to all automotive lifts regardless of specific style.

Funding for the development and validation of these labels was provided by the Automotive Lift Institute, PO Box 33116 Indialantic, FL 32903.

They are protected by copyright. Set of labels may be obtained from ALI or its member companies.

© 1992 by ALI, Inc.
**CAUTION**

Lift to be used by trained operator only.

Authorized personnel only in lift area.

When moving lift, be careful to avoid tipping.

Check for overhead obstructions before raising vehicle.

---

**SAFETY INSTRUCTIONS**

Read operating and safety manuals before using lift.

Proper maintenance and inspection is necessary for safe operation.

Do not operate a damaged lift.

AC ENCLOSURE COMPONENTS:

1. 24VDC POWER SUPPLY – Converts incoming power to 24VDC for control circuit and solenoids.
2. CONTACTOR – Controls switching power to power supply.
3. RELAY, MAIN POWER PRESENCE – Detects if Main Power is connected to the box.
4. RELAY, MAIN POWER SWITCHING – If all cables and dummy plugs connected properly and all E-Stops released, this relay will switch power to the Main Power Contactor Coil.

5. RELAY, PLC BUS – Powers PLC when

6. RELAY, LOCK RELEASE SOLENOID – Switches power to lock release solenoid.

7. CIRCUIT BREAKER – Protects amperage flow from this enclosure’s 24 VDC power supply to its control circuitry.

8. CIRCUIT BREAKER – 3 Phase, protects amperage flow to ALL electrical in enclosure.

9. PROPORTIONAL VALVE CONTROLLER CARD – Controls output to proportional valve.

10. BRANCH TERMINAL STRIP – Junction terminals for incoming and outgoing communication and logic circuit wires.

11. MOTOR CONTACTOR – Switches power onto motor when contactor coil energized.

12. MOTOR OVERLOAD – Breaks power to motor when amperage setting exceeded.

13. MAIN POWER CONTACTOR (MASTER ONLY) – Controls power switching to multiple columns of entire mobile system.

14. MAIN POWER SWITCH (MASTER ONLY) – Turns on power to lift system. (lockable)

15. PHASE RELAY (MASTER ONLY) – Verifies incoming power phasing for proper motor rotation.

16. PROGRAMABLE LOGIC CONTROLLER (PLC) – Controls input and output logic of post and communicates with other PLC’s in post system. Provides 24 VDC to all push buttons.
SIDE PORTS (VIEW OF PANEL MAY DIFFER):
21. MAIN POWER SWITCH (MASTER ONLY) – Turns on Power to lift system.
22. MAIN POWER CONNECTION RECEPTACLE – Place where Main Power lead connects.
23. COMMUNICATION RECEPTACLE – Place where communication cable or dummy plug connects.
24. PENDANT RECEPTACLE (MASTER ONLY) – Place where hand pendent connects.
COMMUNICATION CABLE:
31. POWER DISTRIBUTION WIRES (Qty:4) –
   3 “hot” wires and 1 ground
32. SET-UP LOGIC WIRES (Qty:3) –
   These wires verify proper lift setup using all communication cables, dummy plugs and E-Stops required.
33. COMMUNICATION WIRES (Qty:3) –
   These wires provide communication between all the PLC's in the system.

DUMMY PLUGS:
Place Dummy Plugs “A-TS” and “B-TS” in opposite ends of post system at unused communication ports. System will not power up unless dummy plugs in place.
Note: “TS” denotes TouchScreen. Dummy Plugs “A” and “B” from previous generation models NOT to be used on TouchScreen models.

POWER CABLE:
Connect this cable to a Master post to power the system.
FUNCTIONS:
1. POWER MUST BE PRESENT AT ONE MASTER COLUMN.
2. ALL CABLES AND BOTH DUMMY PLUGS MUST BE PRESENT.
3. ALL E-STOP BUTTONS MUST BE RELEASED.
4. ONCE ENERGIZED, ANY E-STOP BUTTON WILL STOP CIRCUIT.
MOHAWK

SCHEMATICS

MP-18-SERIES
(24VDC VERSION)
ELECTRIC/HYDRAULIC
PORTABLE LIFT
24 VDC ENCLOSURE:
MAIN CONTROL PANEL – Showing controls for Raise, Lower, Park, Single/All/Pair, and Emergency Stop. Battery Level Gauge and Lift Display also present.
24 VDC ENCLOSURE PORTS:

1. COMMUNICATION RECEPTACLE – Place where communication cable or dummy plug connects.
2. 12 VDC AUXILIARY POWER RECEPTACLE – Provided to plug in standard electrical items that run on 12 VDC, (i.e. Lights)
3. HORN – Sounds when mechanical locks are released. Volume is adjustable.
4. PENDANT RECEPTACLE – Place where hand pendent connects.
5. COMMUNICATION RECEPTACLE CAP – Can also be used to hold spare dummy plugs.
6. OPERATE LIFT/CHARGE LIFT SWITCH – Turns on Power to post. When post power is turned off, charging is enabled.
7. 120 VAC CHARGER POWER INLET – Connecting a 120 VAC Power Cord to this inlet provides power to the dual battery charger.
ENCLOSURE COMPONENTS (DOOR):
PLC (Programmable Logic Controller) – "Computer" that provides logic to the entire system, controlling all inputs and outputs, and networking with all other posts in the system. Communications are branched off the right side of the PLC to both sides of the box to allow connectivity to other PLC’s in the system.
MASTER ENCLOSURE COMPONENTS (PANEL):

1. **MAIN POWER SWITCH** – Turns on Power to the post.

2. **MAIN POWER FUSE** – 200 Amp rated to protect the whole electrical system, and sized to accommodate the motor amperage.

3. **CONTROL CIRCUIT BREAKERS** – One protects the PLC and the raising/lowering solenoids. A separate breaker protects the Lock Solenoid.

4. **24 VDC (+) TERMINAL BLOCKS** – Provide distribution for the +24 VDC.

5. **24 VDC (-) TERMINAL BLOCKS** – Provide distribution for the -24 VDC.

6. **INPUT/OUTPUT TERMINAL BLOCKS** – Provide distribution to several inputs and outputs.

7. **LOCK RELEASE RELAY (24 VDC)** – When energized, will divert power to lock release solenoid.

8. **CHARGER RELAY (120 VAC)** – Energizes when charger is supplied power (120 VAC) and prevents lift from running when lift is charging.

9. **PROPORTIONAL VALVE CONTROLLER CARD** – Controls output to the hydraulic proportional valve of the power unit.
COMMUNICATION CABLE:
This is a DEVICENET network cable that is 10 meters long (32'-10" Long) with male ends. This cable is readily available from a variety of electrical suppliers that deal in network components.

DUMMY PLUGS:
Place male dummy plugs into opposite ends of post system at unused communication ports.

CHARGER INFORMATION

MP-18-SERIES
(24 VDC VERSION)
ELECTRIC/HYDRAULIC
PORTABLE LIFT
Charger Status Lights:

Each post comes equipped with a dual battery charger which provides charging for two 12 VDC batteries (in series makes 24 VDC). Each charger is rated for 120 VAC, 60 Hz, 4 Amp draw. Keep this in mind if using extension cords and multiple adapters into a single outlet. (4 chargers will draw 4 x 4 amps = 16 amps total). There are three charging levels that the charger progresses through to full charge. Refer to the MINN KOTA MK220D manual enclosed at end of this manual. Bank 1 Refers to battery on the left (as viewed from the control box), Bank 2 is battery on the right (under the charger).

Note that to protect the charger, the lift will not function when power is supplied to the charger receptacle. Once power is supplied to charger receptacle, “Power On” light illuminates on charger and lift control panel will power.

**Bulk Charging Mode:** Each bank will show **Solid Yellow Lights.** (charger delivers full current to batteries until they reach ~75% charge)

**Absorption Charging Mode:** Each bank will show **Flashing Yellow Lights.** (charging current tapers down while battery voltages held at 14.4V at 77DegF.)

**Maintenance / Float Charging Mode:** Each bank will show **Flashing Green Lights.** (charger voltage dropped to 13.4V per bank to maintain full charge on battery)

Ready: Each bank will show **Solid Green Lights.** (batteries have been in maintenance mode for more than 24 hrs).

Any **Red Light** would indicate error in charging. Consult charger section for details.

**NOTE:** Avoid halting charging cycle until batteries are fully charged (this may decrease the life and charge holding capacity of the batteries). Do not recharge fully charged batteries. Status of left battery may differ from status of right battery. Wait until both batteries are fully charged prior to using lift.
OWNER’S MANUAL FOR
MINN KOTA ONBOARD
BATTERY CHARGERS
Models: MK110D, MK210D,
MK220D, MK315D, MK330D

Service Information:
Please call our service department
at 800-227-6433 if you have any
problems with your battery charger.
A technical support representative
will be happy to assist you.

Compliant with FCC
PART 15, Class B
1. SAFETY INFORMATION

IMPORTANT SAFETY INSTRUCTIONS
SAVE THESE INSTRUCTIONS!

This manual contains important safety and operating instructions applicable to the safe and efficient use of your Minn Kota battery charger.

The Minn Kota battery charger is a powerful electrical device. If incorrectly installed, configured or operated, the battery charger can damage batteries and/or electrical equipment. Please read thoroughly the instructions and safety information contained in this manual before operating the battery charger.

WARNING: RISK OF EXPLOSIVE GASES

WORKING IN THE VICINITY OF A LEAD ACID BATTERY IS DANGEROUS. BATTERIES CONTAIN SULFURIC ACID AND PRODUCE EXPLOSIVE GASES. A BATTERY EXPLOSION COULD RESULT IN LOSS OF EYESIGHT OR SERIOUS BURNS. FOR THIS REASON, IT IS OF UTMOST IMPORTANCE THAT YOU FOLLOW THE INSTRUCTIONS EACH TIME YOU USE THE CHARGER.

TO REDUCE THE RISK OF BATTERY EXPLOSION, FOLLOW THESE INSTRUCTIONS AND THOSE PUBLISHED BY THE BATTERY MANUFACTURER FOR ANY EQUIPMENT YOU INTEND TO USE IN THE VICINITY OF THE BATTERY. REVIEW CAUTIONARY MARKINGS ON THESE PRODUCTS AND ON ENGINE, MOTOR OR OTHER EQUIPMENT REQUIRING BATTERY USAGE.

Use of an attachment not recommended or sold by Johnson Outdoors Inc. may result in risk of fire, electric shock, or injury to persons or property.

The charger is not intended for use by young children or infirm persons without supervision. Young children should be supervised to ensure that they do not play with the charger.

To reduce risk of damage to electric plug or cord, pull by the plug rather than the cord when disconnecting the battery charger.

An extension cord should not be used unless absolutely necessary. Use of the improper extension cord could result in a risk of fire or electric shock. If extension cord must be used, make sure:

a) That pins of plug of the extension cord are the same number, size and shape of those of the plug on the battery charger;

b) That extension cord is properly wired and in good electrical condition;

c) That wire in extension cord is proper size as follows:

<table>
<thead>
<tr>
<th>Length of Cord in feet</th>
<th>25</th>
<th>50</th>
<th>100</th>
</tr>
</thead>
<tbody>
<tr>
<td>AWG Size</td>
<td>16</td>
<td>14</td>
<td>12</td>
</tr>
</tbody>
</table>

Do not operate the battery charger with a damaged cord or plug.

Do not operate the battery charger if it has received a sharp blow, been dropped or otherwise damaged in any way.

Do not disassemble the charger. Incorrect reassembly may result in a risk of electric shock or fire.

To reduce risk of electric shock, unplug the charger from outlet before attempting any maintenance or cleaning. Disconnecting the leads will not reduce this risk.

To reduce to risk of shock or spark, never touch the ring terminals together while the charger is plugged into an outlet or extension cord.

External connections to the battery charger shall comply with the United States Coast Guard electrical regulations (33CFR183, Sub Part 1).

2. PERSONAL PRECAUTIONS

Consider having someone close enough nearby to come to your aid when you work near a lead acid battery.

Have plenty of fresh water and soap nearby in case battery acid contacts skin, clothing or eyes.

Wear complete eye protection and clothing protection. Avoid touching eyes while working near battery.
If battery acid contacts skin or clothing, wash immediately with soap and water. If acid enters eye, immediately flood eye with running cold water for at least 10 minutes and get medical attention immediately.

Never smoke or allow a spark or flame in vicinity of battery, engine, motor or other flammable or explosive equipment.

Be extra cautious to reduce risk of dropping a metal tool onto battery. It might spark or short circuit battery or other electrical part that may cause explosion.

Remove personal metal items such as rings, bracelets, necklaces, and watches when working with a lead acid battery. A lead acid battery can produce a short circuit current high enough to weld such items, causing severe burns.

Use the Minn Kota battery charger for charging and maintaining FLOODED / WET CELL, MAINTENANCE FREE, AND AGM / STARVED ELECTROLYTE batteries only. It is not intended to supply power to low voltage electrical systems other than for charging and maintaining batteries. Do not use the charger for charging dry-cell batteries that are commonly used with home appliances. These batteries may burst and cause injury to persons and damage to property.

NEVER charge a frozen battery.

3. PREPARING TO CHARGE

1) If necessary to remove battery from boat or vehicle to charge or maintain, always remove grounded terminal from battery first (if applicable). Make sure all accessories in the boat or vehicle are off, so as not to cause an arc.

2) Be sure area around battery is well ventilated while battery is being charged or maintained.

3) Clean battery terminals. Be careful to keep corrosion from coming in contact with eyes.

4) Add distilled water in each cell until battery acid reaches level specified by battery manufacturer ONLY AFTER the battery has been charged. Adding water to a discharged battery may result in acid leaking out of the battery and causing injury to persons and damage to property. Do not overfill. Study all battery manufacturers’ specific precautions; however, make sure to REPLACE ALL CELL CAPS after refilling so that water evaporation is avoided. Water will evaporate over time if cell caps are not replaced after refilling. For a battery without removable cell caps, such as valve regulated lead acid batteries, carefully follow manufacturer’s recharging instructions. 

NOTE: The battery fluid level should be checked every 30 days

5) Study all battery manufacturers’ specific precautions while charging and recommended rates of charge.

4. DC CONNECTION PRECAUTIONS

1) The Minn Kota charger will only charge 12 volt 6 cell lead acid batteries. Do not connect the output of the charger to any other voltage or type of battery.

2) The charger’s DC output terminals are designed to be permanently mounted and connected to batteries.

3) Connect and disconnect DC output terminals only after removing the AC plug from the electric outlet.

4) The charger output leads must be connected with the correct polarity for the charger to function. The RED lead must be connected to the POSITIVE terminal of the battery and the BLACK lead must be connected to the NEGATIVE terminal of the battery. See section 6 under “CONNECTING THE BATTERIES TO THE CHARGER” for proper connection procedure.

5. GROUNDING AND AC POWER CORD CONNECTION INSTRUCTIONS

The Minn Kota battery charger should be grounded to reduce risk of electric shock. The charger is equipped with an electric AC power cord with a grounded plug. The plug must be plugged into an outlet that is properly installed and grounded in accordance with all local codes and ordinances.

DANGER – Never alter AC cord or plug provided – if it will not fit outlet, have proper outlet installed by a qualified electrician. Improper connection can result in a risk of an electric shock.

CAUTION – To reduce risk of fire or electric shock, connect battery charger directly to grounding receptacle (three-prong). An adapter should not be used with battery charger.
6. INSTALLING THE BATTERY CHARGER

CHOOSING THE MOUNTING LOCATION:
For optimum performance, the charger should be mounted flush on a bulkhead in a protected area away from rain or spray. Do not mount the charger above batteries as lead-acid batteries give off corrosive gasses which will damage the charger over time. Never allow battery acid to drip on charger when reading electrolyte specific gravity or filling battery. Also, as with most electrical devices, do not mount the charger below the waterline of the boat or directly adjacent to fuel tanks.

Each DC output cord is 6 feet long. Make sure that all DC output cords can reach the batteries and that the AC power cord can reach a power source. When using an extension cord, make the AC connection to the charger outside of the battery compartment as far away as practical to reduce the risk of a spark igniting gasses in the compartment.

Each output cord is equipped with a temperature sensor. By monitoring external temperature, the battery charger adjusts the charging profile of the battery to assure full charge without overcharging or undercharging the battery. Attempting to lengthen or shorten the output wires could damage the temperature sensor and affect the charger output.

If the DC battery leads are not long enough, they may be lengthened by splicing and soldering 12 AWG (minimum) wire. Each splice should be covered with dual wall adhesive lined heat shrink tubing to protect the joint from corroding. The splice should be made between the fork in the output cable and the fuse holder. The fuse holder should always remain within 7" of the battery terminals. The maximum extension length is 15 feet. You may contact the Minn Kota Service Department with any questions. Do not splice the AC power cord, as this voids the three year Limited Warranty.

Even though the Minn Kota charger is capable of operating in a high ambient temperature environment, a minimum of 6 inches of unobstructed area should be allowed on all sides of the unit for proper air circulation and cooling. Proper cooling and circulation will allow the charger to operate at peak efficiency.

MOUNTING THE CHARGER:
Due to the weight of the charger and the pounding that boats routinely endure, take the time to securely mount the charger to prevent damage. Mounting with bolts, nuts, and washers is preferable to mounting with screws. Use the largest diameter bolts possible, and use all four mounting holes.

Your battery charger is supplied with an AC plug holder designed to hold the power cord plug when not in use. Mount the AC plug holder with four screws in a convenient dry site to prevent corrosion to the AC plug and to prevent the AC plug from making contact with the battery posts.

CAUTION – Because the body of the battery charger is metallic, do not directly mount the charger to the hull of an aluminum boat. Use a means of isolation (such as wood or plastic) to prevent the charger body as well as mounting fasteners from coming in contact with the aluminum boat structure or hull. Doing so will eliminate any risk of electrolysis that may occur when AC power is connected to the charger.

WARNING – MAKE SURE THE CHARGER IS DISCONNECTED FROM AC POWER BEFORE CONNECTING THE BATTERIES TO THE OUTPUT CORDS.

CAUTION – Before making any connections to batteries in a confined space (such as a battery compartment of a boat), open the door or hatch of the compartment and allow it to air out for 15 minutes. This allows any gasses that have accumulated in the compartment to escape.

CONNECTING THE BATTERIES TO THE CHARGER:
FOLLOW THESE STEPS WHEN THE BATTERY CHARGER IS INSTALLED IN A BOAT OR VEHICLE. A SPARK NEAR THE BATTERY MAY CAUSE BATTERY EXPLOSION. TO REDUCE THE RISK OF A SPARK NEAR THE BATTERY:

1. Position AC and DC cords to reduce risk of damage by hood, door, or moving engine parts.

2. Stay clear of fan blades, belts, pulleys and other parts that can cause injury to persons.

3. Check polarity of battery posts. POSITIVE (POS, P, +) battery post is usually larger in diameter than NEGATIVE (NEG, N, -) post.

4. Determine which post of the battery is grounded (connected) to the chassis (if any). If negative post is grounded to the boat hull or chassis (as in most vehicles), see (5) below. If positive post is grounded to the boat hull or chassis, see (6) below. If neither is grounded, the order in which the output leads are connected does not matter.

5. For negative-grounded boat or vehicle, connect POSITIVE (RED) output terminal to POSITIVE (POS, P, +) ungrounded post of battery first. Then connect NEGATIVE (BLACK) output to NEGATIVE (NEG, N, -) grounded post of battery.

6. For positive-grounded boat or vehicle, connect NEGATIVE (BLACK) output to NEGATIVE (NEG, N, -) ungrounded post of battery first. Then, connect POSITIVE (RED) output terminal to POSITIVE (POS, P, +) grounded post of battery.

7. When disconnecting charger, disconnect AC power cord from electric outlet first.

8. When disconnecting output terminals from battery posts, always do so in reverse sequence of the connecting procedure while as far away from battery as practical.
FOLLOW THESE STEPS WHEN BATTERY IS *OUTSIDE BOAT OR VEHICLE*. A SPARK NEAR BATTERY MAY CAUSE BATTERY EXPLOSION. TO REDUCE THE RISK OF A SPARK NEAR BATTERY:

1. Check polarity of battery posts. POSITIVE (POS, P, +) battery post is usually larger in diameter than NEGATIVE (NEG, N, -) post.

2. Connect POSITIVE (RED) output terminal to POSITIVE (POS, P, +) post of battery.

3. Connect NEGATIVE (BLACK) output terminal to NEGATIVE (NEG, N, -) post of battery.

4. Do not face battery when making final connection.

5. When disconnecting charger, disconnect AC power cord from electric outlet first.

6. When disconnecting output terminals from battery posts, always do so in reverse sequence of the connecting procedure while as far away from battery as practical.

7. A marine (boat) battery does not need to be removed and charged on shore. However, instructions must be followed for location of charger when permanently mounted or used on board.

Each output bank is independent and isolated from one another and the AC input. The Minn Kota charger can charge independent batteries or combinations of batteries hooked in series or parallel without disconnecting the batteries from any switches or wires / straps joining the batteries. See diagram on page 8.

### 7. OPERATING INSTRUCTIONS

Make sure the charger is properly mounted and the DC output cords are connected properly to the batteries. Double check the polarities of the output cords and make sure the correct bank of the charger is connected to the correct battery.

**INDICATOR LIGHTS:**

To begin charging, connect the charger to AC power. All lights will turn on momentarily. The following will be displayed on the charger:

A GREEN power light is lit to indicate AC power is applied. Each bank has YELLOW, GREEN, and RED lights to indicate charging status and error conditions.

Minn Kota's Multi-Stage Charging has three modes of operation that deliver a fast, precise charge profile by automatically controlling current and voltage without overcharging your batteries.

**Stage 1: Bulk Mode**

During this stage, the charger delivers full current until the battery reaches ~75% charge. A YELLOW light is lit for each bank to indicate the battery is charging in the Bulk Mode.

**Stage 2: Absorption Mode**

The charging current tapers down while the battery voltage is held at 14.4V at 77°F. A flashing YELLOW light is lit for each bank to indicate the battery is in the Absorption Mode.

**Stage 3: Maintenance Mode**

When the battery reaches full charge, the charger voltage is dropped to 13.4V at 77°F. A flashing GREEN light is lit for each bank to indicate the battery is in Maintenance Mode and ready to use. After 24 hours, the charger automatically turns off and a GREEN light is lit for each bank to indicate the battery is in long term Maintenance Mode and ready to use. The charger will automatically turn on when the battery voltage drops below 12.6V.
Error Conditions:

1) A **RED** light for each bank is lit if any of the following apply:
   
a) No battery is connected to an output cord. This may also indicate a blown fuse in the fuse holder.
   
b) The battery is connected reverse polarity.
   
c) A short circuit.
   
d) The battery voltage is below 4 volts. The bank will not charge a battery in this condition. (see note below)
   
e) The battery voltage is above 18 volts. The bank will not charge a battery in this condition.

2) A flashing **RED** light is lit for each bank if there is a damaged temperature sensor on the output cord. The bank will not operate if this occurs.

3) Flashing **RED** and **GREEN** lights are lit for each bank if any of the following apply:
   
a) The battery voltage does not rise above 10.5V after 3 hours. The battery may be damaged and will not be charged.
   
b) Charging in Bulk Mode exceeds 20 hours. The battery may be damaged and will not be charged.

**NOTE** – A 12 volt battery with an open-circuit voltage below 4 volts has either been discharged to the point of internal damage, may be heavily sulfated, or may have internal shorted cells. Attempting to charge a battery in this state is dangerous. The battery should be replaced.

**CAUTION** – If a RED light is lit, disconnect the AC power from the charger immediately. Determine the reason based on the above information and take the necessary corrective action to remedy the situation. If you are unable to remedy the situation and need help, call the Minn Kota Service Department at 1-800-227-6433 and a technical support representative will be happy to assist you.

**CAUTION** – We recommend that you not recharge your battery, (or batteries), with the watercraft or motor lower unit in the water during electrical storms. Severe damage to the motor or charging system may occur if lightning strikes nearby or if storm related high voltage conditions exist.

**CAUTION** – Generators with a modified square wave output can damage this MINN KOTA charger. Generators with a sine wave output can be used to power this charger.

**WARNING** – TO REDUCE RISK OF ELECTRIC SHOCK, DO NOT PERFORM ANY SERVICING OTHER THAN THOSE CONTAINED IN THE OPERATING INSTRUCTIONS.

**INLINE FUSE:**
Each output cord has inline fuses on the **RED** and **BLACK** leads located near the ring terminals. These fuses serve as protection from surges and short circuits caused by a damaged charger output cable. If a fuse blows, replace it with the exact type and rating of the original fuse. Improper battery connections will normally not cause a fuse to blow since this is handled by the chargers internal circuitry.

**8. MAINTENANCE / CLEANING / STORAGE INSTRUCTIONS**

Check battery charger for dirt, oil, battery corrosion, etc. Use a water and baking soda solution for cleaning corrosion. Wipe clean using a dry cloth.

Check ring terminals for dirt, oil, and battery corrosion; then disconnect from battery posts and clean as necessary with water and baking soda solution and dry with a clean cloth.

When the charger is not in use, coil the power cord to prevent damage.

If power cord or plug becomes damaged, you may contact the Minn Kota Service Repair Department for service repair information. Otherwise, dispose of the battery charger in compliance with local law. Damaged cords and plugs can cause electric shock or electrocution.

When storing the battery charger, store in a clean dry area.

**NOTE** – This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

Reorient or relocate the receiving antenna.

Increase the separation between the equipment and receiver.

Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.

Consult the dealer or an experienced radio/TV technician for help.

**CAUTION** – Changes or modifications not expressly approved by the party responsible for compliance could void the user’s authority to operate the equipment.
9. TROUBLESHOOTING

PROBLEM:  
Check Connection (Red) light comes on.

SOLUTION:
- Check polarity of leads to battery.
- Check connections to battery and fuses in output cord.
- Check voltage at battery. The bank will not charge a battery below 4 volts or above 18 volts.
- If still not working, call the Minn Kota Service Department at 1-800-227-6433.

PROBLEM:  
Check Connection (Red) light is flashing.

SOLUTION:
- The temperature sensor in the output cord is damaged. Check to make sure the output cord is not damaged. If the output cord was extended, check to make sure the procedure in Section 6 was followed.
- If still not working, call the Minn Kota Service Department at 1-800-227-6433.

PROBLEM:  
Indicator lights will not illuminate.

SOLUTION:
- Check the AC power at the outlet.
- Make sure the GFCI (Ground Fault Circuit Interrupter) on the outlet has not tripped.
- Check the AC power at the end of the extension cord.
- If still not working, call the Minn Kota Service Department at 1-800-227-6433.

PROBLEM:  
The red and green lights are flashing.

SOLUTION:
- Check to make sure there are not any loads on the battery.
- Check the fluid in the battery and add fluid if necessary.
- If the voltage of the battery does not increase above 10.5 volts after 3 hours or does not increase to the absorption voltage of 14.4 volts in 20 hours, then the bank will shut down and will not charge. The battery should be tested.
- If still not working, call the Minn Kota Service Department at 1-800-227-6433.

Deka AGM Series (Absorbed Glass Mat) for longer and safer battery operation

Deka’s AGM (Absorbed Glass Mat) Series uses a special absorbed electrolyte technology that is superior to conventional lead-acid batteries. This completely sealed valve-regulated battery line eliminates gas emissions and acid leakage for longer and safer battery operation.

**How AGM Works**

Unlike conventional “flooded” lead-acid batteries, AGM sealed valve-regulated technology eliminates the need to add water because the oxygen and hydrogen gases react to maintain the necessary amounts of moisture. Highly porous microfiber separators wrapped around the positive plates completely absorb and trap the electrolyte, so there is no excess to spill or leak out of the battery. Oxygen formed from the positive plates during charging passes horizontally through the separator pores to the negative plates, where it reacts with hydrogen and changes back to water to replenish the electrolyte.

**AGM Features** –

- Specially-engineered safety relief valve system effectively **controls critical internal gas pressure**, preventing capacity loss from excessive gas seepage. This one-way valve also prevents outside air from entering the battery—a common cause of failure in most sealed valve-regulated battery designs.
- Fine microfiber **glass separators are highly porous** to hold electrolyte more efficiently and have extremely low electrical resistance for higher capacity.
- Power path grids are **computer-cast and pasted** to uniform thickness, allowing for the exact degree of compression needed for optimum oxygen flow between the plates and separators. (Plates compressed too tightly will impede oxygen flow, while plates packed too loosely allow valuable oxygen to escape to the top of the battery. Both conditions seriously impair performance and shorten battery life.)
- Exclusive **individual plate formation** provides the highest quality and most consistent performance.

**AGM Benefits** –

- **Maintenance-free** construction eliminates the need to add water.
- **Completely sealed** valve-regulated design eliminates acid spills and terminal corrosion.
- **Safer operation** substantially minimizes chance of acid spray, fumes and explosion hazards when charged correctly.
- **Flexible design** can be installed in almost any position. (However, upside-down installation is not recommended.)
- **State-of-charge easily determined** by open circuit voltage.
- **Lower electrical resistance** provides higher discharge rates.
- **High freeze-resistance** offers longer battery life.
- **Resists vibration** damage for longer operating time.
- **Lightweight construction** for easy installation.
- **Requires less charging time** than conventional batteries.

Oxygen diffuses through the horizontal separator pores to the negative plate as this is the only available path.
### Potential Applications of AGM

- Starting, Lighting and Ignition
  - Cars • Trucks • Marine • Snowmobiles
  - Lawn & Garden Tractors
- Traction
  - Wheelchairs • Floor Sweepers • Guided Vehicles
  - Small Fork Lifts • Trolling Motors
- Industrial
  - Cable TV • Emergency Lighting • Exit Lighting
  - Alarm and Security Systems • PBX Systems • Utility Control
  - Switching Equipment • Medical Equipment
  - Recreational Vehicles • Electronic Cash Registers
- Portable Devices
  - Construction Equipment • Portable Pumps and Generators
  - Portable Test and Measuring Equipment
  - Portable Tools • Mobile TV, VCR, VTR

### Warranty Information

- Warranty void if opened or improperly charged. Caution: Constant under- or overcharging will damage any battery and shorten its life. Use a good constant potential, voltage-regulated charger.
- For 12-volt batteries, charge to at least 14.4 volts but no more than 14.6 volts at 68°F (20°C). Do not charge any battery in a sealed container. The AGM Series has more capacity at high discharge rates than conventional deep cycle batteries.

---

### Constant Voltage vs. Temperature

- Shown is the constant charging voltage in relation to the ambient temperature for cyclic and float use.

- Capacity vs. Operating Temperature

- Shown are the changes in capacity for a wider ambient temperature range, giving the available capacity as a percentage of the rated capacity at different ambient temperatures, for three different load examples, with uninterrupted discharge to the appropriate discharge cut-off voltage. The values for the upper edge of the curve were obtained from charging at an ambient temperature of +20°C (68°F) with a voltage limit of 2.3 V/cell. For the lower edge, charging was carried out at the specified ambient temperature. The curves show the behavior of the battery after a number of cycles.
Introduction

Valve-regulated lead-acid (VRLA) technology encompasses both gelled electrolyte and absorbed glass mat (AGM) batteries. Both types are valve-regulated and have significant advantages over flooded lead-acid products.

More than a decade ago, East Penn began building valve-regulated batteries using tried and true technology backed by more than 50 years experience. East Penn's unique computer-aided manufacturing expertise and vertical integration have created a product that is recognized as the highest quality, longest lived VRLA battery available from any source.

East Penn's gel and AGM batteries are manufactured to tough quality standards. East Penn manufactures high power gel and AGM batteries with excellent performance and life.

Applications

VRLA batteries can be substituted in virtually any flooded lead-acid battery application (in conjunction with well-regulated charging), as well as applications where traditional flooded batteries cannot be used. Because of their unique features and benefits, VRLA batteries are particularly well suited for:

- **Deep Cycle, Deep Discharge Applications**
  - Marine Trolling
  - Electric Vehicles
  - Portable Power
  - Personnel Carriers
  - Commercial Deep Cycle Applications

- **Standby and Emergency Backup Applications**
  - UPS (Uninterrupted Power Systems)
  - Emergency Lighting
  - Telephone Switching

- **Unusual and Demanding Applications**
  - Race Cars
  - Off-road Vehicles
  - Marine & RV Starting

- **What is a gel battery?**

  A gel battery is a lead-acid electric storage battery that:
  - is non-spillable, and therefore can be operated in virtually any position. However, upside-down installation is not recommended.
  - is non-spillable, and therefore can be operated in virtually any position. However, upside-down installation is not recommended.
  - Connections must be retorqued and the batteries should be cleaned periodically.

  - Connections must be retorqued and the batteries should be cleaned periodically.

- **What is an AGM battery?**

  An AGM battery is a lead-acid electric storage battery that:
  - is sealed using special pressure valves and should never be opened.
  - is completely maintenance-free.*
  - has all of its electrolyte absorbed in separators consisting of a sponge-like mass of matted glass fibers.
  - uses a recombination reaction to prevent the escape of hydrogen and oxygen gases normally lost in a flooded lead-acid battery (particularly in deep cycle applications).
  - is non-spillable, and therefore can be operated in virtually any position. However, upside-down installation is not recommended.

  - Connections must be retorqued and the batteries should be cleaned periodically.

- **How does a VRLA battery work?**

  A VRLA battery is a “recombinant” battery. This means that the oxygen normally produced on the positive plates of all lead-acid batteries is absorbed by the negative plate. This suppresses the production of hydrogen at the negative plate. Water (H₂O) is produced instead, retaining the moisture within the battery. It never needs watering, and should never be opened as this would “poison” the battery with additional oxygen from the air. Opening the battery will void the warranty.

- **What are the differences between gel batteries and absorbed glass mat (AGM) batteries?**

  Both are recombinant batteries. Both are sealed valve-regulated (SVR) – also called valve-regulated lead-acid (VRLA). AGM batteries and gel batteries are both considered “acid-starved”. In a gel battery, the electrolyte does not flow like a normal liquid. The electrolyte has the consistency and appearance of petroleum jelly. Like gelled electrolyte batteries, absorbed electrolyte batteries are also considered non-spillable – all of the liquid electrolyte is trapped in the sponge-like matted glass fiber separator material.

  The “acid-starved” condition of gel and AGM batteries protects the plates during heavy deep-discharges. The gel battery is more starved, giving more protection to the plate; therefore, it is better suited for super-deep discharge applications.

  Due to the physical properties of the gelled electrolyte, gel battery power declines faster than an AGM battery’s as the temperature drops below 32°F. AGM batteries excel for high current, high power applications and in extremely cold environments.
What is the difference between VRLA batteries and traditional wet batteries?

Wet batteries do not have special pressurized sealing vents, as they do not work on the recombination principle. They contain liquid electrolyte that can spill and cause corrosion if tipped or punctured. Therefore, they are not air transportable without special containers. They cannot be shipped via UPS or Parcel Post or used near sensitive electronic equipment. They can only be installed “upright.”

Wet batteries lose capacity and become permanently damaged if:

- left in a discharged condition for any length of time (due to sulfation). This is especially true of antimony and hybrid types.
- continually over-discharged, due to active material shedding. This is especially true of automotive starting types.

Our gel cells have triple the deep cycle life of wet cell antimony alloy deep cycle batteries, due to our unique design. The shelf life of a VRLA battery is seven times higher than the shelf life of a deep cycle antimony battery.

How do VRLA batteries recharge?

Are there any special precautions?

While our VRLA batteries accept a charge extremely well due to their low internal resistance, any battery will be damaged by continual under- or overcharging. Capacity is reduced and life is shortened.

Overcharging is especially harmful to any VRLA battery because of the sealed design. Overcharging dries out the electrolyte by driving the oxygen and hydrogen out of the battery through the pressure relief valves. Performance and life are reduced.

If a battery is continually undercharged, a power-robbing layer of sulfate will build up on the positive plate, which acts as a barrier to recharging. Premature plate shedding can also occur. Performance is reduced and life is shortened.

Therefore, it is critical that a charger be used that limits voltage. The charger must be temperature-compensated to prevent under- or overcharging due to ambient temperature changes. (See Charging Voltage vs. Ambient Temperature chart on page 11.)

Important Charging Instructions

The warranty is void if improperly charged. Use a good constant potential, temperature-compensated, voltage-regulated charger. Constant current chargers should never be used on VRLA batteries.

Can VRLA batteries be installed in sealed battery boxes?

NO! Never install any type of battery in a completely sealed container. Although most of the normal gasses (oxygen and hydrogen) produced in a VRLA battery will be recombined as described above, and not escape, oxygen and hydrogen will escape from the battery in an overcharge condition (as is typical of any type battery).

For safety’s sake, these potentially explosive gasses must be allowed to vent to the atmosphere and must never be trapped in a sealed battery box or tightly enclosed space!

Can our VRLA batteries be used as starting batteries as well?

Our VRLA batteries will work in SLI (Starting, Lighting and Ignition) applications as long as the charging voltage is regulated to the appropriate values from the tables on page 11. Many vehicle regulators are set too high for gel batteries; therefore, the charging system may require adjustment to properly recharge a gel battery for best performance and life.

AGM batteries excel in low temperature, high current applications such as cold weather starting.

What do the ratings and specifications signify for this line?

All ratings are after 15 cycles and conform to BCI specifications.

\[ CCA = \text{Cold Cranking Amperes at } 0°F (-17.8°C) \]

Cold cranking amperes equal the number of amperes a new, fully charged battery will deliver at 0°F (−17.8°C) for thirty seconds of discharge and maintain at least 1.2 volts per cell (7.2 volts for a 12-volt battery).

\[ CA = \text{Cranking Amperes at } 32°F (0°C) \]

Same as above, tested at 32°F (0°C).

\[ RC = \text{Reserve Capacity at } 80°F (27°C) \]

The reserve capacity is the time in minutes that a new, fully charged battery can be continuously discharged at 25 amperes and maintain at least 1.75 volts per cell (10.5 volts for a 12-volt battery).

\[ \text{Minutes discharged at } 50, 25, 15, 8 \text{ and } 5 \text{ Amperes} \]

Minutes discharged is the time in minutes that a new, fully charged battery will deliver at various currents and maintain at least 1.75 volts per cell. These are nominal or average ratings.

\[ \text{Ampere Hour Capacity at } 20, 6, 3 \text{ and } 1 \text{ Hour Rates} \]

Ampere hour capacity is a unit of measure that is calculated by multiplying the current in amperes by the time in hours of discharge to 1.75 volts per cell. These are nominal or average ratings.

\[ \text{EXAMPLE} \]

10 amperes for 20 hours (10 x 20) = 200 Ah @ the 20-hour rate
8 amperes for 3 hours (8 x 3) = 24 Ah @ the 3-hour rate
30 amperes for 1 hour (30 x 1) = 30 Ah @ the 1-hour rate

Therefore, if you have an application that requires a draw of 17 amperes for 3 hours, you would need a 51 Ah battery (@ the 3 hour rate)... (17 x 3 = 51). However, this is 100% of the capacity of this 51 Ah battery.

Most system designs will specify a battery that will deliver a minimum of twice the capacity required. This means the battery will discharge to 50% of its capacity. Using a 50% depth of discharge (versus 80% or 100%) will dramatically extend the life of any battery. Therefore, when helping to specify a battery for a system, choose a battery with at least twice the capacity required for best performance. If 50 Ah is required, specify at least a 100 Ah battery.
**CHART A**

*Independent Laboratory Testing BCI 2-Hour Life*

*Group Size “27” Batteries East Penn Gel and AGM vs. Competitor*

This chart compares the cycles run until the battery capacity dropped to 50% of the 15th cycle’s capacity (on discharges at the 2-hour rate to a 10.5-volt cutoff).

![Chart A](chart-a.png)

**CHART B**

*Charging Current vs. Charging Time*

Shown is the current needed to charge a battery from 0% to 90% state of charge in a given time. Or time required to change a battery from 0% to 90% state of charge at a given current. For example, to charge an 8G8D (curve H) to 90% in 3.5 hours, 100 amperes are required; at 35 amperes, it would take 10 hours.

![Chart B](chart-b.png)
**CHART C**

**VRLA Battery Voltage During Constant Current Discharge**

*Voltage vs. Percent Discharged*

---

**CHART D**

**Gel Percent Cycle Life vs. Recharge Voltage**

This chart shows the effect on life of overcharging a gel battery.

(e.g.: Consistently charging at 0.7 volts above the recommended level reduces life by almost 60%!)
What are the features and benefits that make East Penn’s VRLA batteries unique?

East Penn Expertise
East Penn builds VRLA batteries to the highest standards. Our manufacturing process features improved controls using state-of-the-art computers and the latest manufacturing technology and equipment. Therefore, the VRLA batteries produced by East Penn consistently meet the highest quality performance and life standards.

Ultrapremium Sealing Valve
A critical feature of any VRLA battery, gelled or absorbed, is the quality of the sealing valve. Not only must the valve keep the cell pressurized and safely release excessive pressure and gas due to overcharging, but it must also keep the cell from being contaminated by the atmosphere. Oxygen contamination will discharge a VRLA battery and eventually ruin the battery.

Our valves are UL recognized and 100% tested after manufacturing. The benefit is reliable performance and long life.

Spillproof and Leakproof
A major advantage of VRLA batteries is their spillproof and leakproof feature. However, all VRLA batteries are not created equal in their degree of non-spillability. Some manufacturer’s AGM batteries are unevenly filled. Over-saturation of the separators leaves liquid electrolyte that could spill. Under-saturation could lead to premature failure. Some gels do not set properly; they remain liquid and can leak or spill.

Our exclusive gel electrolyte is formulated, mixed and controlled to assure proper “set” in every battery. East Penn's computer-controlled gel mixing and filling equipment ensures homogenization of the mix. This assures a gel battery that will not spill or leak. This feature allows our gel cell to be operated in virtually any position. However, we do not recommend an upside-down orientation.

The AGM filling process assures that each cell is saturated with the maximum amount of electrolyte that can be held by the separators, without leaving excess electrolyte that could spill or leak.

Exclusive Gel Formula
The gelled electrolyte is another critical element in this type of battery. Our gelled electrolyte contains sulfuric acid, fumed silica, pure demineralized, deionized water, and a phosphoric acid additive. The phosphoric acid is a key reason that our batteries deliver dramatically longer cycle life than leading gel competitors and 3 times longer cycle life than traditional wet cells.

Exclusive AGM Electrolyte
Our AGM electrolyte contains high purity sulfuric acid and absolutely pure totally demineralized, deionized water to increase battery performance. Since the designs are “acid-starved” to protect the plates from deep discharge, the acid concentration can drop to nearly zero during an extremely deep discharge. Substances that will not dissolve in acid may become soluble when the concentration drops this low. Upon recharge, these dissolved substances crystallize out of the electrolyte, potentially destroying the battery. Our electrolyte prevents these events.

Exclusive Computerized Gel Mixing
Proper gel mixing is critical to life and performance. Consistency in mixing means consistent reliability. We have designed and built the newest, state-of-the-art gel battery manufacturing facility in the world. An example is our proprietary computerized gel mixing operation. Our exclusive formula is mixed using computer control in every stage of the process. Computer control delivers superior consistency for gel battery performance that is unequalled.

Our temperature-controlled process and specially designed equipment assure a homogenous gel. It is important to note that our equipment was designed by our engineers specifically for gel mixing… even down to the contour of the tank bottoms and feed pipe locations. No other battery manufacturer has comparable equipment.

Multi-Staged Filling/Vacuuming Operation
Most other manufacturers fill their gel cells in a one step process, vibrating the battery with hopes of releasing most of the air pockets. This system is less than perfect and leaves voids or air pockets at the critical gel-to-plate interface. These voids are non-reactive and reduce overall battery performance.

Our process fills and vacuums each cell several times. This multi-step process assures complete evacuation of air and complete gel-to-plate interface. Our computerized process also weighs every battery before and after filling as a check for proper gel levels. The benefit is more power-per-pound of battery.

Our AGM topping process assures that the maximum retainable electrolyte quantity is held within the battery separators, without leaving any unabsorbed liquid to spill or leak.

Tank Formed Plates
East Penn is the only battery manufacturer that uses tank formation to activate the battery plates. This process guarantees a fully formed and voltage matched plate. The extra handling of the plates provides an additional inspection step in the process to verify plate quality.

Ultrapremium, Gel Glass Mat, Double Insulating Separators
Another critical component is the separator, which isolates the positive from the negative plate. The separator must allow maximum charge flow between the plates for maximum performance. Separator failure is a leading cause of warranty claims and customer dissatisfaction.

East Penn uses an ultrapremium grade separator in our gel batteries. We believe that this expense (which is 5 to 6 times higher than other types) is worth the benefits of extended life and performance:

- The fiberglass mats embed themselves into the surface of the plates, acting like reinforcing rods in concrete. This extra reinforcement locks the active material onto the plate for longer life and extended performance.
- The ultra-clean separators have no oil contamination or other impurities. Therefore, resistance is low and battery performance is high.
- Excellent porosity allows maximum charge flow, which means more power-per-pound.
- Superior resistance to oxidation dramatically reduces separator failure, which extends life.
- Our separators are especially suited for gel batteries, while others use separators designed for flooded automotive batteries.
**Ultrapremium AGM glass mat separators**

Glass mat separator properties can vary considerably. East Penn uses glass mat engineered to have an ideal balance of properties—i.e. absorbency, compressibility, puncture resistance and electrical resistance. This attention to detail results in high performance and long life.

**Exclusive Thru-Partition Weld Seals**

One of the causes of self-discharge in batteries is the minute electrical currents that flow between each cell through the partition at the weld area. These currents accelerate the discharge of batteries not in use.

We block these currents by using an exclusive weld seal or gasket. This feature dramatically reduces self-discharge to less than 3% per month: the lowest self-discharge rate of any battery manufacturer and seven times lower than many conventional batteries!

**Exclusive Patented Calcium/Copper Lead Alloy Grids**

This exclusive alloy provides longer shelf life, more power-per-pound and superior corrosion resistance. By using special grain refiners, we can dramatically improve performance and life.

**Heavy-Duty Motive Power Style Grid Design**

While other manufacturers cut costs by using automotive style grids, we use a high-performance deep cycle grid. This heavy-duty grid design is similar to the grid in a motive power battery.

The hefty “power rods” designed into our grids not only lock the active material onto the grid, but also act as “bus bars” to collect and direct the energy to the terminals. The benefit is more power-per-pound of battery for your equipment and longer battery life.

**Multiple Plate Lug Milling**

Shiny, well milled plate lugs are critical to our superior cast-on-strap quality. Each of our plate lugs is automatically milled to assure the highest quality strap with no loose or dropped plates. Our lugs are then fluxed and tinned automatically for an additional assurance of quality.

**Heavier Plate Straps**

We use an exclusive lead/tin alloy in a unique multi-stage cast-on-strap operation. The result is heavier straps with outstanding lug-to-strap knit. This eliminates dropped and loose plates, thereby improving performance and life.

**Polyester Element Wrap**

Another cause of deep-cycle battery failure is “mossing.” This phenomenon occurs late in a battery’s life, as the positive active material actually grows around the edge of the separator and eventually “shorts” against the negative plate. This ends the battery’s service life.

Our AGM separators wrap around the bottom of the plate and are wider than the plates. This makes mossing failures unlikely. To prevent life-shortening mossing in our gel batteries, we use a special polyester fiber sheet that is wrapped around the edge of each element, similar to the wrap in an industrial battery. The result is longer service life.

**Exclusive Forged Posts and Bushings**

“Black” posts and oxygen-contaminated batteries are often due to porous lead terminal posts. A battery can lose its critical pressure through tiny pores and fissures in the battery terminals. Pressure loss is harmful to the battery and is evident by black posts, which are caused by sulfuric acid fumes escaping from the battery through and around the lead posts and bushings. These fumes can cause corrosion and can damage sensitive electronic equipment.

These pores and fissures are caused by the industry's method of casting posts and bushings. This method produces tiny air pockets and paths which allow corrosive gas to escape, causing life shortening depressurization, cell dry-out and corrosion damage.

To eliminate this problem, we use forged terminal posts and bushings, which are completely solid with absolutely no porosity. The benefit is longer life, better performance and no leakage of corrosive gas…especially important when installed in or near sensitive electronic equipment.

**Acid Stratification Prevention**

Acid stratification can occur in conventional wet cells. During charge, acid is released at the plate surfaces. During discharge, acid is consumed at the plate surfaces. Since the concentration is not uniform, diffusion (spontaneous mixing by random molecular motions) begins. If this mixing occurred rapidly, stratification would not occur, but it is relatively slow, allowing lighter parts of electrolyte to “float” toward the surface and heavier parts to “sink” toward the bottom.

The top portion of the plates do not perform as well in contact with lower concentration electrolyte. The bottom portion of the plates do not perform as well with the higher concentration, and will corrode prematurely. High voltage “equalization” charging is sometimes used in wet batteries to make gas bubbles that re-mix the electrolyte.

Because the immobilized gel will not “float” or “sink” within itself when a non-uniform concentration exists, it cannot stratify. Therefore, no high-voltage equalizing charge is necessary. Simply recharge at the standard 13.8 to 14.1 voltage setting. This means longer life and consistent performance in stationary and standby applications.

Electrolyte in an AGM battery is strongly held by the capillary forces between the glass mat fibers, but not completely immobilized. Stratification is possible in extremely tall cells, but cannot occur in batteries of the size covered in this document.

**Convenient Carrying Handles**

Carrying handles are included on the (gels) 8G11H, 8G24, 8G27, 8G30H, 8G31DT, 8G31, 8G4D and 8G8D models. Handles are also available on (AGM) 8AU1H, 8A24, 8A27, 8A31DT, 8A44D and 8A8D. This feature makes carrying, installation and removal easier, more convenient and less time consuming.

**Dozens of Terminal Options Available**

Our batteries are delivered with the most popular type of terminal; however, on a special order basis many terminal options are available. This gives you total flexibility to specify the proper terminal for your application... without making compromises.
Proprietary Case, Cover, and Pressure Vent

We design and mold our own rugged polypropylene cases, vents and covers in our on-site, state-of-the-art plastics molding facility. This provides ultimate control of our high performance designs, quality and delivery to our manufacturing plant, assuring you the highest quality battery and most reliable service.

Environment and Worker Protection

It’s nice to know that every possible safeguard was designed into our process to protect our co-workers and the environment… special safeguards that are exclusive to East Penn. One benefit is assurance of a consistent source for batteries without fear of governmental interference or delays.

Over 250 Quality Assurance Checks

Hundreds of quality checks are performed to assure total confidence in the performance and life of our batteries.

For example:

- **100% Cycling.** After initial charging, every battery is discharged and then recharged at the factory. This allows us to check the performance of the battery and give it a second charge that equalizes the cells for improved performance and longer life.

  It’s interesting to note that, as a cost-saving measure, we use the current generated during the initial discharge to recharge other batteries in this computer-controlled process.

- **Extended Shelf Stand Test.** Before shipment, every battery is required to stand for a designated period of time. Beginning and ending voltages are compared. This extra quality assurance step verifies that the critical pressure control valves are functioning properly.

- **Filling Weight Control.** During this computerized process, batteries are weighed before and after filling. This assures that the exact amount of electrolyte is in each battery.

- **Multi-Staged Filling and Vacuuming Process.** Every battery is filled and vacuumed several times during this computerized process. Multi-staged vacuuming assures complete electrolyte-to-plate interface, with no power-robbing air pockets.

- **Computerized Polarity Check.** Every battery is checked by computer for proper polarity.

- **High Rate Discharge Test.** Every battery is discharged at approximately twice the rated capacity. A sensitive computer monitors the voltage drop during this discharge to assure that every battery performs as designed.

- **Formed Element Inspection.** Elements are assembled and charged outside the battery container in a computerized forming and drying process. This allows visual inspection of every grid, plate, separator, and formed element before being sealed inside the battery, assuring perfect cell elements with longest life and highest performance.

- **Tank Formed Plates.** Voltage matched plates are critical in standby applications. Forming each plate outside the battery assures the highest quality, best matched plates in the industry, and also allows a visual check before and during assembly.

State-of-the-Art Technology

Within our newly constructed multi-million dollar VRLA production facility, we have incorporated state-of-the-art manufacturing processes that are unmatched by any other battery manufacturer. This major addition allows us to build the most modern and reliable VRLA batteries in the industry.

The designs of East Penn’s VRLA batteries are always improving. The preceding sections accurately describe East Penn’s VRLA products as of the date of publication. East Penn reserves the right to change their processes to improve quality, value or utilize advances in manufacturing technology. Ratings and capacities may change without notice.

How do we justify the premium price of VRLA batteries to those unfamiliar with this type of battery?

Simply review the advantages, features and benefits, performance, and impressive life cycle results. Based upon this and the lowest cost-per-month or duty cycle you and/or your customer should have no trouble choosing VRLA batteries.

However, please remember that these batteries are not for everyone or every application. Always be aware of the charging considerations. (See pages 11 & 12.)

What are the advantages and disadvantages of the different types of battery designs?

**Gelled Electrolyte Advantages:**
- Totally maintenance-free
- Air transportable
- Spillproof/leakproof
- No corrosion
- Superior deep cycle life
- Installs upright or on side (side installation may lose about 10% capacity)
- Very low to no gassing (unless overcharged)
- Compatible with sensitive electronic equipment
- Superior shelf life
- Superior rechargeability (from 0% to 90% in 3½ hours)
- Rugged and vibration-resistant
- Very safe at sea with no chlorine gas in bilge (due to sulfuric acid and salt water mixing)
- Versatile: Starting, Deep Cycle, Stationary
- Operates in wet environments…even under 30 feet of water
- Will not freeze to –20°F/–30°C (if fully charged)
- Lowest cost-per-month (cost ÷ months of life)
- Lowest cost-per-cycle (cost ÷ life cycles)

**Gelled Electrolyte Disadvantages:**
- Higher initial cost
- Heavier weight
- Water cannot be replaced if continually overcharged
- Automatic temperature-sensing, voltage-regulated chargers must be used
- Charge voltage must be limited to extend life (13.8 to 14.1 volts maximum at 68°F)

**Absorbed Electrolyte Advantages:**
- Totally maintenance-free
- Air transportable
- Spillproof/leakproof
- No corrosion
- Installs upright or on side
- Lower cost than gel cell batteries
- Compatible with sensitive electronic equipment
- Very low to no gassing (unless overcharged)
- Excellent for starting and stationary applications
- Superior for shorter duration/higher rate discharges
- Superior under extreme cold conditions when fully charged
- Superior shelf life
- Superior rechargeability (from 0% to 90% in 3½ hours)
- Rugged and vibration-resistant
- Very safe at sea with no chlorine gas in bilge (due to sulfuric acid and salt water mixing)
- Operates in wet environments…even under 30 feet of water

**Absorbed Electrolyte Disadvantages:**
- Shorter cycle life than gel in very deep cycle applications
- Automatic temperature-sensing, voltage-regulated chargers must be used
- Water cannot be replaced if continually overcharged
- Charge voltage must be limited (14.4 to 14.6 volts maximum at 68°F)

**Flooded Electrolyte Advantages:**
- Lowest initial cost
- Higher cranking amps
- Water can be added (if accessible)
- Excellent for starting applications
- Tolerant of improper recharge voltage
- Certain designs are good for deep cycle applications
- Replacements readily available
- Good under extreme cold conditions when fully charged

**Flooded Electrolyte Disadvantages:**
- Spillable
- Operates upright only
- Lower shelf life
- Fewer shipping options
- Cannot be installed near sensitive electronic equipment
- Watering may be required (if accessible)
Why can’t VRLA batteries be opened?

VRLA (Valve-Regulated Lead-Acid) batteries, sometimes called SLA (Sealed Lead-Acid) batteries or SVR (Sealed Valve-Regulated) batteries work on a recombination principle. Oxygen gas is produced at the positive plates during charge. The charged negative plates react first with this oxygen and subsequently with the electrolyte. Water is produced and the negative plates are very slightly discharged. Additional charging recharges the negative plates instead of producing hydrogen gas. Since very little hydrogen and oxygen are lost and the water (H₂O) is retained, we say that the gases have recombined. To work properly, the oxygen produced must be retained in the battery until the reaction is completed. Positive pressure allows the gas to be retained.

If any VRLA (gelled or absorbed electrolyte) battery is overcharged, gas will be vented from the valves. Hydrogen as well as oxygen will be released. If continued, the electrolyte will eventually dry out and the battery will fail prematurely. This is why charging limits are so critical.

In a sealed battery a balance is maintained between the hydrogen, oxygen and charge. If a VRLA battery is opened, or leaks, the negative plates are exposed to extra oxygen from the atmosphere. This excess oxygen upsets the balance. The negative plates become charged. The positive plates may be subsequently severely overcharged. The battery will fail prematurely, and the warranty will be voided.

Some say calcium grids don’t do well in flooded deep cycle applications. Why does East Penn use calcium grids in VRLA batteries for deep cycle applications?

Flooded calcium alloy makes a very efficient, low resistance battery. Therefore, when deeply discharged, the plates release all their available power, eventually causing plate shedding and active material fall-out. In contrast, with flooded antimony batteries, the antimony helps lock the active material onto the grid. Therefore, the plate does not shed as easily, which extends the deep cycle life of the battery when compared to flooded calcium.

Our VRLA calcium alloy battery (East Penn’s exclusive patented alloy) is also very efficient with low resistance. However, when deeply discharged, the electrolyte is used up before the plates are totally discharged because the battery is “acid-starved.” This feature:

• limits the discharge the plates can deliver.
• protects the plates from shedding due to deep discharge.
• extends the life of the battery.

Why do EPM VRLA batteries have longer cycle life than others?

Some of the major features that contribute to our long cycle life are:

• Our VRLA batteries are protected against deep discharge because they are “acid-starved.” This means that the battery uses the power in the acid before it uses the power in the plates. Therefore, the plates are never subjected to destructive ultra-deep discharges.

• With proper temperature-sensing, voltage-regulated charging (refer to table on page 11) the VRLA battery never runs out of water.

• Our gel batteries contain ultra-premium, glass-mat, dual-insulating separators which will not break down in service. The glass mat embeds itself into the plate, which retards life-shortening shedding.

• Our gel batteries contain polyester element wrap which retards “mossing” or active material growth that causes short circuits.

• Our AGM batteries contain separators at the ideal compression and ideal saturation to achieve the best balance between capacity utilization and recombination efficiency.

• Over 250 quality control checks assure superior performance and long battery life.

Why do EPM VRLA batteries have longer shelf life?

Our calcium/copper lead alloy premium separators and demineralized electrolyte are ultra-pure. Impurities in the lead alloy, separators and electrolyte cause tiny currents inside a cell which eventually discharge the battery and shorten its shelf life. The purer the components, the longer the shelf life. No one can match East Penn’s purity!

Our exclusive “weld seal gasket” blocks the minute cell-to-cell currents that cause self-discharge. The better the weld seal, the longer the shelf life. Weld seals are exclusive to East Penn VRLA batteries.

Does depth of discharge affect cycle life?

Yes! The harder any battery has to work, the sooner it will fail.

* You may experience longer or shorter life based upon application, charging regimen, temperature, rest periods, type of equipment, age of battery, etc.

As you can see, the shallower the average discharge, the longer the life. This is why it’s important to size a battery system to deliver at least twice the average power required, to assure shallow discharges.
Follow these tips for the longest life:

- Avoid ultra-deep discharges.
- Don’t leave a battery at a low stage of charge for an extended length of time. Charge a discharged battery as soon as possible.
- Don’t cycle a battery at a low state of charge without regularly recharging fully.
- Use the highest initial charging current available (up to 30% of the 20-hour capacity per hour) while staying within the proper temperature-compensated voltage range.

**Why can’t EPM VRLA batteries be discharged too low?**

Our VRLA batteries are designed to be “acid-starved.” This means that the power (sulfate) in the acid is used before the power in the plates. This design protects the plates from ultra-deep discharges. Ultra-deep discharging is what causes life-shortening plate shedding and accelerated positive grid corrosion which can destroy a battery.

**Why does temperature have such a dramatic effect on batteries?**

Temperature is a major factor in battery performance, shelf life, charging and voltage control. At higher temperatures there is dramatically more chemical activity inside a battery than at lower temperatures. The following charts graphically illustrate this fact.

**AGM Charge and Float Voltages at Various Temperature Ranges**

**What is acid stratification?**

See page 6 for a detailed explanation of this phenomenon.

**How does a battery recharge?**

The process is the same for all types of lead-acid batteries: flooded, gel and AGM. The actions that take place during discharge are the reverse of those that occur during charge.

The discharged material on both plates is lead sulfate (PbSO4). When a charging voltage is applied, charge flow occurs. Electrons move in the metal parts; ions and water molecules move in the electrolyte. Chemical reactions occur at both the positive and negative plates converting the discharged material into charged material. The material on the positive plates is converted to lead dioxide (PbO2); the material on the negative plates is converted to lead (Pb). Sulfuric acid is produced at both plates and water is consumed at the positive plate.

If the voltage is too high, other reactions will also occur. Oxygen is ripped from water molecules at the positive plates and released as a gas. Hydrogen gas is released at the negative plates—unless, oxygen gas can reach the negative plates first and “recombine” into H2O.

A battery will “gas” near the end of charge because the charge rate is too high for the battery to accept. A temperature-compensating, voltage-regulating charger, which automatically reduces the charge rate as the battery approaches the fully charged state, eliminates most of this gassing.

It is extremely important not to charge batteries for long periods of time at rates which cause them to gas because they use water, which in sealed valve-regulated batteries cannot be replaced. Of course, no battery should be overcharged for a long period of time...even at low rates using so-called “trickle charges.”

In a fully charged battery, most of the sulfate is in the sulfuric acid. As the battery discharges, some of the sulfate begins to form on the plates as lead sulfate (PbSO4). As this happens, the acid becomes more dilute, and its specific gravity drops as water replaces more of the sulfuric acid. A fully discharged battery has more sulfate in the plates than in the electrolyte.

The following illustration shows the relationship between specific gravity readings and the combination of the sulfate from the acid with the positive and negative plates at various states of charge.
How critical is recharge voltage?

Why are all VRLA batteries so charge sensitive?

All lead-acid batteries give off hydrogen from the negative plate and oxygen from the positive plate during charging. VRLA batteries have pressure-sensitive valves. Without the ability to retain pressure within the cells, hydrogen and oxygen would be lost to the atmosphere, eventually drying out the electrolyte and separators.

Voltage is electrical pressure. Charge (ampere-hours) is a quantity of electricity. Current (amperes) is electrical flow (charging speed). A battery can only store a certain quantity of electricity. The closer it gets to being fully charged, the slower it must be charged. Temperature also affects charging.

If the right pressure (voltage) is used for the temperature, a battery will accept charge at its ideal rate. If too much pressure is used, charge will be forced through the battery faster than it can be stored. Reactions other than the charging reaction occur to transport this current through the battery—mainly gassing. Hydrogen and oxygen are given off faster than the recombination reaction. This raises the pressure until the pressure relief valve opens. The gas lost cannot be replaced. Any VRLA battery will dry out and fail prematurely if it experiences excessive overcharge.

Note: It is the pressure (voltage) that initiates this problem—a battery can be “over-charged” (damaged by too much voltage) even though it is not fully “charged.”

This is why charging voltage must be carefully regulated and temperature compensated to the values on page 11.

How long does it take to recharge a fully discharged VRLA battery?

A specific time is difficult to determine because recharging depends on so many variables:
- Depth of discharge
- Temperature
- Size and efficiency of the charger
- Age and condition of the battery

See the following Charging Guides for an estimated time based upon the initial charge current the battery accepts.

Typical Charging Time vs. 90% and 100% State of Charge

<table>
<thead>
<tr>
<th>State of Charge</th>
<th>60% of time</th>
<th>40% of time</th>
</tr>
</thead>
<tbody>
<tr>
<td>0%</td>
<td>3½ hours</td>
<td>6 hours</td>
</tr>
</tbody>
</table>

It will take about 60% of the charge time to bring a VRLA battery from 0% charged to 90% charged. It will take the remaining 40% of the total charging time to put the last 10% of the charge back into the battery.

Charge is a quantity of electricity equal to rate of flow (Ampere-hours), times (hours), and usually expressed in Ampere-hours (Ah).

0% state of charge is defined as the depth of discharge giving a terminal voltage of 10.50 volts measured under a steady load at the 20-hour rate at 80°F. (The 20-hour rate is the 20-hour capacity divided by 20 hours.)

Typically, the charge that must be returned to a VRLA battery to achieve a 100% state of charge is from 105% to 115% of the charge removed.

Charging Guides

Typical Charge Time vs. Initial Charge Current to 90% Full Charge
(Using an automatic temperature-sensing, voltage-regulating charger set at 13.8V. Totally discharged battery at 11.80–12.0 volts.)

*approximate

HOW TO USE THIS CHART: When charger is first turned on, read amps after about one minute. Initial ampere reading will indicate approximate charging time.

EXAMPLE:
If an 8G24 reads about 17 ampere charge current when first turned on, the battery will be at 90% in about 6 hours.

IMPORTANT: Always use an automatic temperature-sensing, voltage-regulated charger! Set charger at 13.8 to 14.1 volts at 68°F for gel, or 14.4 to 14.6 volts at 68°F for AGM. Do not exceed 14.1 volts for gel or 14.6 volts for AGM.
How can continual undercharging harm a battery?

In many respects, undercharging is as harmful as overcharging. Keeping a battery in an undercharged condition allows the positive grids to corrode and the plates to shed, dramatically shortening life. Also, an undercharged battery must work harder than a fully charged battery, which contributes to short life as well.

An undercharged battery has a greatly reduced capacity. It may easily be inadvertently over-discharged and eventually damaged.

How can you tell if an VRLA battery is fully charged?

By using a voltmeter.

How can you tell if a VRLA battery has been damaged by under- or overcharging?

The only way is with a load test. Use the same procedure you would use with a wet cell battery:

a. Recharge if the open circuit voltage is below 75%.
b. If adjustable, set the load at ½ the CCA rating or three times the 20 hour rate.
c. Apply the load for 15 seconds. The voltage should stabilize above 9.6 volts while on load.
d. If below 9.6 volts, recharge and repeat test.
e. If below 9.6 volts a second time, replace the battery.

What is a float charger?

What float voltage is recommended?

This type of charger continually delivers a pre-set voltage to the battery, regardless of charge conditions.

These chargers are used in stationary, emergency back-up power, emergency lighting, and other applications.

The frequency of discharge and temperature will dictate a more exact setting. For example, the more frequent the discharge, the higher the suggested recharge voltage, to a maximum of 2.35 volts per cell (at 20°C/68°F).

Our recommended float voltage is 2.25 to 2.3 volts per cell for gel and absorbed models.

What is a thermal runaway?

The appropriate charge voltage depends on the battery temperature (see page 11). A warmer battery requires a reduced voltage. If the voltage is not reduced, current accepted by the battery increases. When the current increases, the heating increases. This can continue in a loop feeding on itself with the battery temperature and charging current rising to destructive levels.

Gel batteries are much less susceptible to thermal runaway than AGM batteries. Batteries may become more susceptible with increasing age. Without a recombination reaction, flooded batteries convert most excess charging energy to gas, not heat. This makes them almost immune from the thermal runaway.

Thermal runaway can be prevented with:

• Temperature compensation monitoring at the battery—not at the charger.
• Limiting charging currents to appropriate levels (see page 11).
• Allowing for adequate air circulation around the batteries.
• Using timers, or Ampere-hour counters.
• Using smart chargers that recognize the signature of a thermal runaway event which will shut the charger down.

How do I know if a charger is “gel friendly” or “AGM friendly”?

Unfortunately, many chargers on the market claim to be gel “friendly” or “OK for sealed batteries”, but are not. Some overcharge the batteries, while others may not fully charge the batteries. Some chargers claim to be “smart”. Some “smart” chargers do a good job, others do not. The best choice of charger often depends on the application.

Use only “voltage-regulated” or “voltage-limited” chargers. Standard constant current or taper current chargers must not be used. The voltage must fall in the range of the chart on page 11. Almost all applications require temperature sensing and voltage compensation. Beware, many chargers measure the ambient temperature which could be significantly different from the battery’s internal temperature.

Low frequency current ripple (to about 333 Hz) can be detrimental to sealed batteries depending on the application. On applications where the charger is connected continuously to a float voltage, especially where simultaneous charge and discharge may occur, the level of current ripple must be a consideration.

If you are not sure if a charger is performing properly, follow this procedure:

a. Using a fully discharged VRLA battery (OCV about 11.8V) and a digital voltmeter, record the initial open circuit voltage at the battery terminals.
b. Using an automatic charger as described above, set voltage if adjustable (14.1V for gel, 14.4V for AGM models).
c. Connect and start charging. Record initial on-charge voltage and current .
d. Each hour or so, check and record the on-charge voltage across the battery terminals. Except for occasional, brief “blips” or pulses, the voltage should not exceed the voltage limits noted in “b” above.
e. At the end of charge (when the current is very low or goes
to zero) check and record the voltage. Note that the charger
may have turned off by then.
f. The disconnected battery should be at 100% or above after a
24 hour rest.
During the charging time, the charger should not have exceeded
the limit (except for occasional, brief pulses). This indicates that
the charger is working properly.
Keep in mind that the voltage limit is at 68°F/20°C. Charging at
higher or lower temperatures will change this limit.
A temperature-sensing charger should always be used, as
manual adjustments are never accurate and will damage any
VRLA battery.

Do VRLA batteries have a
“memory” like ni-cad batteries?
One of the major disadvantages of nickel-cadmium (ni-cad)
batteries is that after shallow discharge cycles, the unused portions
of the electrodes “remember” the previous cycles and are unable
to sustain the required discharge voltage beyond the depth of the
previous cycles. The capacity is lost and can only be restored by
slowly discharging completely (generally outside the application),
and properly recharging. VRLA batteries do not exhibit this
“use it” or “lose it” capacity robbing effect known as memory.

What is a safe charge rate or voltage
setting for outdoor applications with wide
temperature fluctuations if a temperature-
sensing charger is not available?
NONE! As the chart on page 11 (Effect of Temperature on
Recharge Voltage) shows, charging voltage varies widely with
temperature. There is no fixed voltage setting or current that
will work. A temperature-sensing, voltage-regulated charger
must be used. Anything else will damage any battery and cause
premature failure!

Can a VRLA battery be load tested?
Yes. See page 13 (How can you tell if a VRLA battery has been
damaged by under- or overcharging?).

Why do some VRLA batteries bulge?
Why do some VRLA batteries appear
“sucked in”? Are there visual signs of a
faulty or plugged pressure relief valve?
To prevent the permanent loss of gases so that recombination
has time to take place, each cell can hold up to about 1.5 psi
without venting.
Batteries with very large cells, such as the 8G4D, 8G8D, 8A4D, 8A8D
and 8GC2, will bulge somewhat as this normal pressure builds. This
is especially true in higher temperatures, because the polypropylene
case is pliable. Therefore, a certain amount of bulge is normal.

The valves only let gas out, never in. A partial vacuum can form
within a sealed battery under various circumstances. Battery temper-
ature and ambient pressure play a role, but predominantly the
recombination and discharge reactions are responsible. After charging
ends, the recombination reaction continues until most of the oxygen
in the battery headspace is consumed. The total volume of the battery
components decreases slightly during a discharge. Deeply discharged
batteries often have a “sucked-in” appearance. Batteries with large
cells may display this appearance even when fully charged.

If a battery bulges severely on charge, this is not normal. It is an
indication of a blocked valve or an overcharge situation. Such a
battery should be removed from service.

A sucked-in appearance can also be normal. A sucked-in battery
should be charged, but if it remains sucked-in after charging, the
appearance can safely be ignored; however, if only a single cell
displays or lacks this appearance a load test would be prudent.

How safe are VRLA batteries?
Can they explode?
VRLA batteries are very safe, unless abused. However, as with any
type battery, certain safety precautions must be taken.

ALWAYS WEAR SAFETY GLASSES
WHEN WORKING AROUND BATTERIES!

CALIFORNIA PROPOSITION 65 WARNING: Batteries, battery posts,
terminals and related accessories contain lead and lead compounds
and other chemicals known to the state of California to cause cancer
and birth defects or other reproductive harm. Wash hands after
handling.

Because VRLA batteries normally emit very little to no hydrogen gas,
they are safe near sensitive electronic equipment. They do not
cause corrosion of surrounding metals. No hydrogen gas means
no dangerous explosions... UNLESS SEVERELY OVERCHARGED!

Do not install any lead-acid battery in a sealed container or enclo-
sure. Hydrogen gas from overcharging must be allowed to escape.

DO NOT CHARGE IN EXCESS OF 14.1V @ 68°F - Gel Cells
14.6V @ 68°F - Absorbed

Always use a reliable, temperature-sensing, voltage-regulated,
automatic charger.

Because SVR batteries have immobilized electrolyte, they cannot
spill or leak, even if punctured. That is why they are approved for air
transport by the International Commercial Airline Organization (ICAO),
International Airline Transport Association (IATA), and Department of
Transportation (DOT) as noted on the label if properly insulated from
short circuits.
Also, when protected against short circuits and securely braced/blocked, our VRLA batteries "are not subject to any other requirements of 49 CFR Parts 171-180..." for shipping.

**Which way does current flow? On which side should a circuit breaker be installed?**

During discharge, electrons progress through the external circuit from the negative post toward the positive post. Inside the battery, positive ions move toward the positive plate by diffusion where they react, leaving neutral molecules in solution. The resulting neutral molecules move back toward the negative plate by diffusion. There are also negative ions in the electrolyte offsetting the positive ion charges. Some travel by diffusion toward both the negative and the positive plates, where they are consumed. During charge, all of the directions reverse.

Although not physically accurate, when designing circuits or making calculations, it is just as valid to consider positive charges moving through the whole circuit. Indeed, this is the convention used to define the direction of current in electronics (known as conventional current).

**Proper location of disconnects depends on the application.**

Vehicles can vary, but in most cases, the negative terminal is treated as ground. The entire chassis is connected to the negative terminal of the battery. The positive side of the circuit is considered “hot.”

**Switches/circuit breakers should usually be installed on the hot side of a device.** When disconnecting the entire battery from the system with a fusible link or circuit breaker, breaking the connection from the negative terminal to the chassis often works best.

In multiple battery installation, there could be other considerations such as total voltage, multiple voltages, and the effects on other devices.

**Battery Installation**

**Note:** In a multi-battery installation, it is often best to replace the entire set of batteries when one battery is weak or has failed.

**Series**

A “series” system increases the voltage, but keeps the battery capacity (cranking amps, amp hours, reserve minutes, and minutes running time) the same. Therefore, two 12-volt batteries connected in series (POS to NEG, NEG to POS) will deliver 24 volts at the same rating as one battery: During recharge, each battery receives the same amount of current; e.g. if the charger is putting out 10 amps, both batteries are getting 10 amps.

**Parallel**

A “parallel” system increases the capacity available, but keeps the voltage the same. Therefore, two 12-volt batteries with 400 CCA, 110 R.C and 65 Ah will deliver 12 volts, 800 CCA, 220 R.C and 130 Ah. (Actually, since each battery’s load is lighter, the reserve capacity will more than double.)

**Wiring and Waterproofing**

**Always wear safety glasses when working around batteries!**

a. Cabling of the approved gauge should be tinned copper. If using untinned copper, allow plenty of spray silicone to "wick" along the strands.

b. Install heat-shrink tubing with a silicone interior; the silicone forms an excellent moisture barrier. Cut the tubing long enough to cover the terminal lug and plenty of the insulated portion of the cable. Slip tubing onto the cable.

c. Crimp on the appropriate terminal.

e. Clean battery terminals and connect. Be sure perfect metal-to-metal contact is made, with no dirt, corrosion, grease or foreign material to interfere with current flow.

f. Always attach the cable connected to the solenoid or starter first. Attach the ground cable last! Tighten snugly, BUT DO NOT OVERTIGHTEN, which will damage the terminals or crack the battery cover. This will destroy the battery and VOID THE WARRANTY.

---

g. Spray exposed terminals and connectors with several coats of battery terminal corrosion protection spray. (Mask surrounding areas to protect against overspray.)

h. For batteries which may be exposed to very wet environments (e.g. bilge mounted batteries) total encasement of the exposed terminals and connectors is necessary. However, do not block or cover the vents. Allow ventilation.

A battery terminal boot should be used. Install the boot on the cable before crimping the terminal. Fill the boot with petroleum jelly and fit over the sprayed connectors (as in “g” above).

i. Battery charging in a boat requires a charger specifically designed for marine applications. In addition to battery gases, bilges often contain potentially dangerous fuel fumes. Follow all wiring and grounding recommendations of the charger manufacturer for on-board and on-shore connections. Using a charger not specifically designed for marine applications or failure to follow the marine charger manufacturer’s grounding and wiring recommendations could result in major corrosion damage to the hull or prop, and create a serious risk of electrical shock or fire, personal injury or death.

**What do I need to know about installation, especially in salt water marine applications?**

**Series hookup**

increases voltage...

\[2 \times 12\text{V} = 24\text{ Volts}\]

**Parallel hookup**

keeps same voltage...

\[2 \times 12\text{V} = 12\text{ Volts}\]
During recharge, the current (amps) is split between the batteries. The battery that is discharged the most will receive more current than the other until both are brought up to full charge.

**Series/Parallel**

A “series/parallel” system provides a combination of voltage and capacity for special applications. Note: Never mix different types and sizes of batteries in the same bank.

**Dual Voltage**

The illustration shows an arrangement that would supply 24 volts to a starter and 12 volts to the electronics (or vice versa).

To properly recharge, a sophisticated “battery isolator” should be installed. Otherwise, one battery will be continually overcharged and the other undercharged in a dual-voltage set-up.

**IMPORTANT:** Do not install any type of battery in a completely sealed box or enclosure. In the event of overcharging, the potentially explosive gasses must be allowed to escape.

**RECYCLING IS CRITICAL**

Did you know lead-acid batteries are virtually 100% recyclable? They have a higher recycling rate than other waste products such as aluminum, paper, glass and plastic. Be sure to return your lead-acid batteries to a dealer. In most states it is illegal to discard a battery in the trash.

**BE CAREFUL!**

**WARNING:** Batteries produce explosive gases. Keep sparks, flames, and cigarettes away from batteries at all times. Protect your eyes at all times. Never lean over battery when jumping or performing other maintenance. Remember... always wear safety glasses when working around batteries!

**DANGER/POISON**

**FLUSH EYES IMMEDIATELY WITH WATER.**

**SULFURIC ACID CAN CAUSE BURNING OR SEVERE BURNS.**

**KEEP OUT OF THE REACH OF CHILDREN. DO NOT TIP. KEEP VENT CAPS TIGHT AND LEVEL.**

**DO NOT OPEN FLUSH COVER BATTERIES.**

**RECYCLING IS CRITICAL.**

Did you know lead-acid batteries are virtually 100% recyclable? They have a higher recycling rate than other waste products such as aluminum, paper, glass and plastic. Be sure to return your lead-acid batteries to a dealer. In most states it is illegal to discard a battery in the trash.

**CHECK THE STATE OF CHARGE**

Always wear safety glasses when working around batteries. Batteries can explode! Protect your eyes.

- **MAINTENANCE-FREE NON-ACCESSIBLE TYPES, WITH NO FILLER CAPS:**
  1. Check the state-of-charge of the battery with a voltmeter. If the reading is above 12.4 volts, the battery is at least 75% charged and should be OK. If below 12.4 volts, see the Charging Tips section.

- **ACCESSIBLE TYPES, WITH FILLER CAPS:**
  1. Using a voltmeter: Check the state-of-charge of the battery. If the reading is above 12.4 volts, the battery is at least 75% charged and should be OK. If below 12.4 volts, see the Charging Tips Section. Or,
  2. Using a hydrometer: Check the state-of-charge of the battery by taking a reading from one cell. Use a different cell each time. If the reading is above 1.225 specific gravity, the battery is at least 75% charged and should be OK. If below 75%, see the Charging Tips section.

**BE CAREFUL!**

**The various types of batteries used in Marine and RV service are:**

- Maintenance-Free Non-Accessible Engine Starting with no filler caps
- Low-Maintenance Accessible Starting with filler caps
- Dual Purpose (Starting/Cycling) with filler caps
- Deep Cycle with filler caps

You may have one or more of the same type or different types on board your boat or RV. Determine which type of battery or batteries you have and follow the correct set of instructions.

**SERVICE TIPS (continued)**

Look for loose connections or hold-downs. Tighten snugly if appropriate. DO NOT OVER-TIGHTEN TO AVOID BATTERY DAMAGE!

2. Keep the batteries and battery compartment clean and corrosion free. Dirty, corroded batteries can self-discharge, which will affect performance and life.

Clean corrosion with a paste made from baking soda and water. Apply liberally. Any corrosion is neutralized when the solution stops bubbling. Wash off with large quantities of water to avoid environmental damage.

3. Shine lead posts and terminal ends with a wire brush or steel wool to clean corrosion and assure a low resistance connection. Reassemble and coat lead parts with petroleum jelly or a terminal protection spray.

Repaint hold-down, tray and surrounding parts if necessary.

**CHECK THE STATE OF CHARGE (continued)**

For each 10 degrees below 80ºF (27ºC), subtract four points to the hydrometer reading. For example, at 80ºF (32ºC) a hydrometer reading of 1.250 would be corrected to 1.254. Likewise, at 70ºF (21ºC) a hydrometer reading of 1.250 would be corrected to 1.246.

If the electrolyte level is too low to read with a hydrometer, add distilled water as noted below and run the engine or equipment at least two hours to mix the electrolyte and avoid a false reading.

3. Check electrolyte levels in all cells. If necessary, add distilled water (or clear, odourless drinking water). Do not use water with high iron content to avoid battery damage. **Never add acid, only water to a battery.** If it will be necessary to charge the battery, bring the levels in all cells to just above the separators inside the cells to allow for expansion during charging. Top off after charging as noted below.

If it is not necessary to charge the battery, (or after charging) top off by filling each cell with distilled water to just below the filler tube in each cell.

**LOAD TESTING**

Always wear safety glasses when working around batteries. Batteries can explode! Protect your eyes.

Using a voltmeter or hydrometer will tell you if your battery is charged. But these tests will not indicate if a battery can “hold a load.” A battery can be fully charged, but be so weak or worn out that it can no longer perform its function of starting an engine or running accessory loads. Therefore, you must also perform a load test to determine the state of health of your battery.

1. Follow the instructions on the variable load tester or ask your favorite service dealer to load test your battery.
2. If the battery maintains a minimum “on load” voltage of 9.6 volts for 30 seconds, it is in good condition. If not, recharge and load test again.
3. If it fails a second time, replace the battery immediately.

**TYPES OF MARINE / RV BATTERIES**

The various types of batteries used in Marine and RV service are:

- Maintenance-Free Non-Accessible Engine Starting with no filler caps
- Low-Maintenance Accessible Starting with filler caps
- Dual Purpose (Starting/Cycling) with filler caps
- Deep Cycle with filler caps

You may have one or more of the same type or different types on board your boat or RV. Determine which type of battery or batteries you have and follow the correct set of instructions.

**SERVICE TIPS**

Always wear safety glasses when working around batteries. Batteries can explode! Protect your eyes.

1. Perform a visual inspection. Inspect for defective or cracked case and cover, and loose or damaged terminal posts or cables. Replace battery and/or cables immediately if any damage is found.

2. If it fails a second time, replace the battery immediately.

**CHECK THE STATE OF CHARGE**

Always wear safety glasses when working around batteries. Batteries can explode! Protect your eyes.

- **MAINTENANCE-FREE NON-ACCESSIBLE TYPES, WITH NO FILLER CAPS:**
  1. Check the state-of-charge of the battery with a voltmeter. If the reading is above 12.4 volts, the battery is at least 75% charged and should be OK. If below 12.4 volts, see the Charging Tips section.

2. If the battery maintains a minimum “on load” voltage of 9.6 volts for 30 seconds, it is in good condition. If not, recharge and load test again.
3. If it fails a second time, replace the battery immediately.
CHARGING TIPS
Always leave filler caps in place, tight and secure to reduce the risk of battery explosion and serious injury!
Always wear safety glasses when working around batteries. Batteries can explode. Protect your eyes.
Do not charge batteries without proper instruction.
1. Batteries should be charged if hydrometer reading is below 1.225 specific gravity, or open circuit voltage is below 12.4 volts, or if the first load test is below 9.6 volts as noted previously.
2. Carefully read and follow the instructions that came with the charger to avoid serious injury, property damage and/or battery damage.
3. Unplug the charger before connecting or disconnecting a battery to avoid dangerous sparks which can cause a battery to explode.
4. Do not leave a battery on charge for more than 48 hours to avoid damaging the battery by over-charging. If gassing or spewing of electrolyte occurs, or the battery case feels hot, reduce or temporarily halt charging to avoid damaging the battery.
5. Stop the charge when two hydrometer or voltage readings recorded two hours apart indicate no increase. Further charging would be useless and may damage the battery.
6. NEVER attempt to charge a frozen battery. To avoid explosion and serious injury, allow it to warm to 60°F (16°C) before charging.
7. NEVER leave a battery on a trickle charger longer than 48 hours. Serious damage to the battery WILL occur.

OFF-SEASON STORAGE
Batteries that are not in use during the off-season must be cared for as follows to extend battery life and reliability:
1. Disconnect the batteries to avoid self-discharge due to parasitic loads such as clocks, ground faults, etc.
2. Put into storage fully charged and keep them above 75% state-of-charge. Check state-of-charge every 90 days and recharge if necessary.
3. Ideally, store batteries in a cool, dry place with temperatures not below 32°F (0°C) or above 80°F (27°C). Typically, batteries will self-discharge at faster rates at higher temperatures.

### TEMPERATURE vs. SELF-DISCHARGE RATE

<table>
<thead>
<tr>
<th>Temperature (°F)</th>
<th>Self-Discharge Rate</th>

SECTION III

PHYSICAL/CHEMICAL CHARACTERISTICS

Electrolyte (Sulfuric Acid):
Appearance and Odor: Clear, Odorless, colorless liquid
Boiling Point: 235 – 240°F
Evaporation Rate (Butyl Acetate=1): less than 1.0
Melting Point: N/A
Solubility in Water: 100%
Specific Gravity (H₂O=1): 1.270 – 1.330
Vapor Density (AIR=1): Greater than 1
Vapor Pressure (mm Hg): 10

SECTION IV

FIRE AND EXPLOSION HAZARD DATA

Flash Point (Method Used): Non-Flammable
Extinguishing Media: Class ABC extinguisher,
Flammable Limits: *Hydrogen Gas
LEL: 4%       UEL: 74%
NOTE: CO₂ may be used, but not directly on the cell. The thermal shock may cause cracking of the battery case and/or cases.
* Hydrogen gas may be generated during battery changing.

SECTION V

REACTIVITY DATA

Stability: Stable
Condition to Avoid: Prolonged overcharging, sources of ignition

Incompatibility (Materials to Avoid): Sulfuric Acid: Contact with combustibles and organic materials may cause fire and explosion. Also reacts violently with strong reducing agents, metals, strong oxidizers and water. Contact with metals may produce toxic sulfur dioxide fumes and may release flammable hydrogen gas.

Hazardous Decomposition of By-Products: Sulfuric Acid: Excessive overcharging or fire may create Sulfur trioxide, carbon monoxide, sulfuric acid mist, sulfur dioxide, and hydrogen.
Lead Compounds: Contact with strong acid or base or presence of nascent hydrogen may generate highly toxic arsine gas.
SECTION VI
HEALTH HAZARD DATA

Route(s) of Entry: Not Applicable under normal use.

Carcinogenicity:
Sulfuric Acid: The International Agency for Research on Cancer (IARC) has classified “strong inorganic acid mist containing sulfuric acid” as a Category 1 carcinogen, a substance that is carcinogenic to humans. This classification does not apply to liquid forms of sulfuric acid contained within a battery. Inorganic acid mist (sulfuric acid mist) is not generated under normal use of this product. Misuse of the product such as overcharging, may result in the generation of sulfuric acid mist.
Lead Compounds: Lead is listed as a 2B carcinogen, likely in animals at extreme doses. Proof of carcinogenicity in humans is lacking at present.
Arsenic: Listed by National Toxicology Program (NTP), IARC, OSHA and NIOSH as a carcinogen only after prolonged exposure at high levels.

Signs and Symptoms of Exposure: Avoid contact, with absorbed electrolyte (sulfuric acid) may cause irritation of eyes, nose and throat. Contact with eyes and skin causes irritation and skin burns. Absorbed electrolyte is corrosive.

Medical Conditions Generally Aggravated by Exposure: Pregnant women and children must be protected from lead exposure.

Health Hazards (Acute and Chronic): Do not open battery, avoid contact with internal components. Internal components include lead and absorbed electrolyte. Electrolyte is corrosive and contact may cause skin irritation and chemical burns.

Emergency and First Aid Procedures: (contact with electrolyte)
1) Flush contacted area with large amounts of water for at least 15 minutes. Remove contaminated clothing and obtain medical attention if necessary. Eye wash and/or emergency shower should be readily available.
2) If swallowed, give large volumes of water. DO NOT induce vomiting, obtain medical treatment.

SECTION VII
PRECAUTIONS FOR SAFE HANDLING AND USE

Waste Disposal Method: Lead-acid batteries are completely recyclable. For information on returning batteries to East Penn for recycling, contact your East Penn Representative. Dispose of any collected material in accordance with local, state or applicable federal regulations.

Precautions to be Taken in Handling and Storing: Store away from reactive material as defined in Section V, Reactivity Data. Place cardboard between layers of stacked batteries to avoid damage and short circuit. Do not allow metallic materials to simultaneously contact both terminals.

Other Precautions: If battery case is broken, avoid direct contact with internal components. Keep away from ignition sources during charging.

SECTION VIII
CONTROL MEASURES

Respiratory Protection (Specific Type): N/A

Ventilation: Must be provided when charging in an enclosed area.

Protective Gloves: Recommended

Eye Protection: Recommended

Other Protective Clothing or Equipment: N/A

Work Hygienic Practices: Good Personal hygiene and work practices are recommended.
### SECTION IX

**OTHER REGULATORY INFORMATION**

<table>
<thead>
<tr>
<th>NFPA Hazard Rating</th>

Note: Sulfuric acid is water-reactive if concentrated.

**U.S. DOT:** Batteries, wet, non-spillable, electric storage

- Hazard Class/Division: 8
- ID Number: UN2800
- Packing Group: III
- Label Requirements: Corrosive

**RCRA:** Spent lead-acid batteries are not regulated as hazardous waste when recycled. Spilled sulfuric acid is a characteristic hazardous waste, EPA hazardous waste number D002 (corrosivity).

**CERCLA (Superfund) and EPCRA (Emergency Planning and Community Right to Know ACT)**

a) Reportable Quantity (RQ) for spilled 100% sulfuric acid is 1000 lbs.
b) Sulfuric acid is a listed “Extremely Hazardous Substance” under EPCRA with a Threshold Planning Quantity (TPQ) of 1000 lbs.
c) Batteries are subject to EPCRA reporting requirements under sections 302/304, 311/312, and 313.

**California Prop 65:** Batteries, battery posts, terminals and related accessories contain lead and lead compounds, and other chemicals known to the State of California to cause cancer and birth defects or other reproductive harm. WASH HANDS AFTER HANDLING.

For additional information concerning East Penn Manufacturing Co., Inc. products or questions concerning the content of this MSDS please contact your East Penn representative.

This information is accurate to the best of East Penn Mfg. Co.’s knowledge or obtained from sources believed by East Penn to be accurate. Before using any product, read all warnings and directions on the label.
CHASSIS LIFTING BEAM

See next page for chassis beam diagram and specifications.

If it is desired to raise a vehicle by the frame, this can be done by using optional chassis lifting beams. The chassis lift beam fits into the cradle where the tire would normally fit and spans between a pair of posts. The beam comes with lifting pads and height adapters that slide and stack along the beam to accommodate the frame pick up points.

Directions for Use:
Drive vehicle into bay.
Roll chassis beam under desired end of vehicle where frame pick points are.
Slide pads to desired positions and stack adapters as desired to accommodate frame pick points.
Roll posts to each end of chassis beam, cradling ends of chassis beam with forks.
Lift pair until chassis beam contacts frame.
Verify proper frame engagement.
Check other posts for proper engagement of tires or frame (depending on if another chassis beam is used or the other end is lifted by tires)
Operate lift as desired.

NOTICE:
The chassis beam is rated for 35,000 lbs total.
Always ensure that the beams are cradled in the forks as close as possible to the carriages. (Do not place beams on tips of forks) Also, ensure that vehicle is centered on chassis beam to ensure even loading of beam and posts.
This beam is intended to be used in conjunction with another beam or another set of mobile column posts to lift the entire vehicle. Do not use this beam to pick up just one end of a vehicle only. Load beam only on lifting pads, do not load beam on center.
This beam is intended for use on Mohawk MP-Series 15” Long Fork lifts ONLY.

THIS ACCESSORY HAS BEEN TESTED AND CERTIFIED BY A NATIONALLY RECOGNIZED TESTING LABORATORY (NRTL) TO MEET THE REQUIREMENTS OF ANSI/ALI ALCTV-2011 FOR AUTOMOTIVE LIFT CONSTRUCTION.

### Chassis Lifting Beam

These beams can be rolled on the floor between to Mohawk MP-Series mobile lifts and lifted by the column forks. Beams include twin lifting pads to engage vehicle chassis.

**Capacity:**
- 35,000 lbs per beam
- (35,000 lbs per pair)
WING PLOW ADAPTERS

See next page for wing plow adapter diagram and specifications.

The wing plow adapters are to be used when it is desired to raise a vehicle with side wing plows or RV’s with side extensions where the forks are not able to get close to the tires. The wing plow adapters are used with a pair of posts to enable lifting of the whole front axles of a vehicle by the tires.

Directions for Use:
Drive vehicle into bay.
Roll wing plow adapters around each side of front axle tires (center tires on beam lengths).
Roll posts to each end of adapters, inserting forks fully into adapter sockets.
Lift pair until wing plow adapters engaged tires.
Verify proper engagement.
Check other posts for proper engagement of tires.
Operate lift as desired.

NOTICE:
The wing plow adapters are rated for 25,000 lbs total (per pair of beams, see spec on next page) Always ensure that the wing plow adapters are fully inserted over the lifting forks. Also, ensure that vehicle is centered on the wing plow adapters to ensure even loading of beams and posts. These adapters are intended to be used in conjunction with another set of mobile column posts to lift the entire vehicle. Do not use these to pick up just one end of a vehicle only. These adapters are designed to lift only tires and must not be top loaded. Do not use these to pick up vehicles by frames. Use adapters only in pairs. These adapters must not be single loaded. The wing plow adapters are intended for use on Mohawk MP-Series 15” Long Fork lifts ONLY.
Wing Plow Beam Adapters
A.K.A. RV SLIDE OUT ADAPTERS

These beams can be rolled on the floor between two Mohawk MP-Series mobile lifts and lifted by the column forks. Beams are used in pairs to engage a full set of tires in the same manner that the lifting forks would. Length of beam gives lift the ability to raise plows with side wing plows or RV’s with side extensions.

Capacity: 25,000 lbs per Post Pair
FORK TRUCK ADAPTERS

See next page for fork truck adapter diagram and specifications.

The fork truck adapters are to be used when it is desired to raise a fork truck by the undercarriage for wheels free servicing. The fork truck adapters are used with a pair of posts.

Directions for Use:
Locate a pair of posts (Master and Slave) in the desired lifting location.
Assembly ramps and pads onto posts as shown in specification diagram.
Drive fork truck onto pads until center of gravity of fork truck is at center of pad.
Locate rubber blocks as desired to contact frame.
Lift pair until fork truck pad engaged fork truck frame.
Verify proper frame engagement with pads.
Lift pair approximately 6 inches verifying that truck center of gravity is centered on pad.
Shake truck slightly to ensure secure and balanced support of frame.
Operate lift as desired.

WARNING:
Any removal of components from vehicle while raised may alter the center of gravity of the vehicle and produce an unsafe or unstable condition of the vehicle or the lifting system that may cause injury to personnel or damage to equipment. Ensure vehicle center of gravity is always located at center of lifting pads. Use jack stands as an added measure of safety to ensure load stabilization.

NOTICE:
The fork truck adapters are rated for 14,000 lbs per post (28,000 lbs per post pair).
Always ensure that the fork truck adapter pads are fully inserted over the lifting forks inboard against fork tubes. (not on tips of forks). Also, ensure that fork truck center of gravity is centered on the adapter pads to prevent offset loading of posts.
Do not use these to pick up just one end of a vehicle only. Do not use these to pick up vehicles by tires. Use adapters only in pairs. These adapter are designed only to pick up fork trucks.
The fork truck adapters are intended for use on Mohawk MP-Series 15” Long Fork lifts ONLY.
Fork Truck Adapters

These adapters consist of 2 ramps, 2 frame pads and 2 front wheel supports that set on top of the standard Mohawk MP-series mobile lift forks. As the lift raises, the frame pads are lifted by the forks while the ramps and front wheel supports stay on the floor.

Capacity: 14,000 lbs per pad (per post) (28,000 Lbs Total per set)
HMMWV ADAPTERS

See next page for HMMWV adapter diagram and specifications.

The HMMWV adapters are specifically to be used when it is desired to raise a HMMWV (Hummer) by the front and rear bumpers for wheels free servicing. These adapters can also be used to pick up mobile military generators, a/c units, etc. These adapters are used with a pair of posts.

**Directions for Use:**
- Drive the vehicle into the lifting area.
- Slip the HMMWV adapters over the forks of a master and slave post.
- Drop the fork retainer pins in the holes at the carriages.
- Locate posts at the front and rear of the vehicle.
- Locate lifting pads at desired locations to contact frame at bumper ends.
- Ensure pads are at widest settings possible.
- Lift pair until pads engaged frame.
- Verify proper frame engagement with pads.
- Lift pair approximately 6 inches.
- Shake truck slightly to ensure secure and balanced support of frame.
- Operate lift as desired.

**WARNING:**
Any removal of components from vehicle while raised may alter the center of gravity of the vehicle and produce an unsafe or unstable condition of the vehicle or the lifting system that may cause injury to personnel or damage to equipment. Ensure vehicle center of gravity is always located at center of lifting pads. Use jack stands as an added measure of safety to ensure load stabilization.

**NOTICE:**
The HMMWV adapters are rated for 12,000 lbs per post (24,000 lbs per post pair)
Always ensure that the HMMWV adapters are fully inserted over the lifting forks and retaining pins are inserted into carriage holes. Also, ensure that HWWMV center of gravity is centered on the between the pads to prevent offset loading of posts.
Do not use these to pick up just one end of a vehicle only. Use adapters only in pairs.
The HMMWV adapters are intended for use on Mohawk MP-Series 15” Long Fork lifts ONLY.
THIS ACCESSORY HAS BEEN TESTED AND CERTIFIED BY A NATIONALLY RECOGNIZED TESTING LABORATORY (NRTL) TO MEET THE REQUIREMENTS OF ANSI/ALI A5CTV-2011 FOR AUTOMOTIVE LIFT CONSTRUCTION. FOR USE WITH MOHAWK MP-SERIES LIFTS WITH 15” FORKS.

HMMWV Adapters
A.K.A. FRONT TO REAR BUMPER ADAPTERS
A.K.A. U.S.A.F GENERATOR ADAPTER

These adapters slip over the standard forks of the Mohawk MP-18 Series lifts and convert the lift into a "2-Post Frame Engaging Lift". They can also be used to pick by the bumpers. Designed specifically for military HMMWV's.

Capacity: 12,000 lbs per post
(24,000 Lbs Total)

Accessories include:
(4) Lifting Pads, Square
(4) Lifting Pads, Square, 1"
(4) Lifting Pads, Square, 2"
(4) 3" Height Adapters
(4) 6" Height Adapters
FRAME CONTACT ADAPTERS

See next page for Frame Contact Adapters diagram and specifications.

The frame contact adapters are designed to convert a mobile column lift post pair into a frame engaging lift for wheels free servicing. These adapters are used with a pair of posts.

Directions for Use:
Drive the vehicle into the lifting area.
Slip the frame contact adapters over the forks of a master and slave post.
Drop the fork retainer pins in the holes at the carriages.
Locate posts at the both sides of the vehicle.
Locate lifting pads at desired locations to contact frame pick up points.
Ensure pads are at widest settings possible for stability.
Lift pair until pads engaged frame.
Verify proper frame engagement with pads.
Lift pair approximately 6 inches.
Shake truck slightly to ensure secure and balanced support of frame.
Operate lift as desired.

WARNING:
Due to the nature of this design where loading of the adapters is outside the base envelope of the posts, this is a non-certifiable option and voids the certification on the lift it is used on.

WARNING:
Any removal of components from vehicle while raised may alter the center of gravity of the vehicle and produce an unsafe or unstable condition of the vehicle or the lifting system that may cause injury to personnel or damage to equipment. Ensure vehicle center of gravity is always centrally located between the lifting pads. Use jack stands as an added measure of safety to ensure load stabilization.

NOTICE:
The frame contact adapters are rated for 4,000 lbs per post (8,000 lbs per post pair)
Always ensure that the frame contact adapters are fully inserted over the lifting forks and retaining pins are inserted into carriage holes. Also, ensure that vehicle center of gravity is centered between the pads to prevent offset loading of posts.
Do not use these to pick up just one end of a vehicle only. Use adapters only in pairs.
The frame contact adapters are intended for use on Mohawk MP-Series 15” Long Fork lifts ONLY.
Auto Frame Contact Adapters

These adapters slip over the standard forks of the Mohawk MP-18 Series lifts and convert the lift into a "2-Post Frame Engaging Lift".

Capacity: 4,000 lbs per Post
(8,000 lbs Total per Post pair)

Accessories include:
(4) Lifting Pads
(4) 3" Height Adapters
(4) 6" Height Adapters

Note: Due to the nature of this design extending beyond the base frame of the posts, this is NOT a certified option and use of this option on a certified lift void the certification of the lift.
**Model A-7**
The A-7 is a 7,000 lb. capacity asymmetric lift that allows full opening of all vehicle doors as well as total undercar/underdash access, thanks to Mohawk’s unique “clear floor” design. Low 4” arms accommodate all imports and low-riding sports cars. Includes both 3” and 6” adapters.

**Parallelogram Lifts**
Standard models from 36,000 to 100,000 lb. capacities with track lengths from 26'-48’. Available in surface or flush mount with full under-vehicle access for all trucks, buses and heavy equipment.

**Models System I, LC-12, LMF-12, TP-16, TP-18, TP-26 & TP-30**
These 10,000 to 30,000 lb. capacity models are the ideal heavy-duty lifts for up to Class VI trucks. Mohawk’s unique “clear floor” design makes these the perfect lifts for all fleet applications. Truck adapters are also standard equipment.

**MP-Series Mobile Column**
Mohawk’s mobile columns are capable of lifting 32,000 to 240,000 lbs. All columns operate together, individually or can be divided into separate pairs. Adjustable lifting forks accommodate the widest range of vehicles. No wheel reducer sleeves needed.

**TR-Series Ramp Style Lifts**
Standard models from 19,000 to 120,000 lbs. for total under-vehicle access. Available in 20’, 25’, and 30’ long runways. Completely operated by a single technician and feature fully interlocked, redundant safety systems.
SEND US YOUR PHOTOS!

MOHAWK IS ALWAYS INTERESTED IN SEEING HOW YOUR LIFTS ARE USED. WE HAVE CREATED AN ON-LINE PHOTO DATABASE FOR CUSTOMERS TO VIEW OUR LIFTS IN USE.

VISIT WWW.MOHAWKLIIFTS.COM/PR/ AND MAYBE WE CAN ADD YOUR PHOTOS TO OUR COLLECTION. (JPG FORMATS PREFERED)

E-MAIL YOUR PHOTOS AND COMMENTS TO: PHOTOS@MOHAWKLIIFTS.COM

BEST REGARDS & HAPPY LIFTING!
